orthographic, or orthogonal, projection. These projections are commonly made, one on a horizontal plane (called the plane of the figure), and one on a vertical plane (called the elevation), e.g., take a circle as the given figure, and let H V be the planes of projection intersecting in $X'X$. Draw PP_2 $P'P'_2$, perpendicular to H , and PP_4 $P'P'_4$, perpendicular to V . The rays from P determine the plane perpendicular to XX' at P_2 and those from P' determine a plane perpendicular to XX' at P'_2 . Continuing in this way, the circle is projected into an ellipse on H and into an ellipse on V . The plane V may now be revolved about XX' as an axis through 90° , causing the projection $P_2P'_2$ to form $P_4P'_4$, and thus representing two projections of the circle in the same plane. This process is entirely reversible, from which it is clear that a figure may be constructed from its projections. Descriptive geometry is a powerful agent in solving the problems of mechanics and the constructive arts, e.g., in the planning of machinery, arches, and conduits

Projective Geometry As the name suggests, this investigates the properties of figures by

means of projections. The fundamental idea is that of transforming a plane figure into a plane figure by means of projective pencils, or three-

dimensional figures into three-dimensional figures by means of a sheaf of rays. In the broader sense projective geometry also includes the study of the corresponding forms of various dimensions, e.g., the axial pencil (planes with a common axis) corresponds to the pencil of rays (lines with a common point). If two ranges of points, as A, B, C and A', B', C' , or as A, B, C and A'', B'', C'' , in the accompanying figure, are such that the lines which join corresponding points concur, as at S , the two ranges are said to be in perspective, but A, B, C and A'', B'', C'' are said to be projective. The anharmonic ratio (see ANHARMONIC RATIO) of projective ranges is constant, i.e., $(A''B''C''D'') = (ABCD)$. This property forms the basis of the general definition of projective plane figures, which may be stated thus: Any two plane figures in which for every point of the one there is a point in the other, and for every line in the one there is a line in the other, and so related that the anharmonic ratios of any corresponding ranges of four points or corresponding pencils of four lines are equal, are said to be projective

Hypergeometry Generalization has led geometers to imagine other spaces than that in which we live and to seek the properties of figures existing in space of more than three dimensions. The result has been the building up of a geometry of hyperspace or of n dimensions. Reasoning in this geometry is possible only by the use of symbols. Since a line segment, i.e., a figure of one dimension, is represented by an algebraic quantity of degree 1, such as a , since a square, having two dimensions, is represented by the algebraic expression a^2 , and, finally, since a cube, having three dimensions, is represented by the algebraic expression a^3 —the idea naturally suggests itself that some figure of four dimensions corresponds to the symbol a^4 , and that, in general, some figure of n dimensions corresponds to the symbol a^n . The fact that four dimensions cannot be represented in the three-dimensional space in which we live has little bearing upon the idea itself, a three-dimensional figure (a solid) cannot completely be represented on a plane, and yet mathematical thought involving the concept of three-dimensional space would remain logical and useful even if all actual figures were only two-dimensional

The idea of the fourth dimension thrusts itself upon the mind even more prominently in studying rectangular coordinates in analytic geometry, $ax = b$ represents a point, one axis being necessary, $ax + by = c$ represents a line, two axes being necessary, and $ax + by + cz = d$ represents a plane, three axes being necessary. This suggests that $ax + by + cz + dw = e$ may represent a three-dimensional figure in a four-dimensional space. It is evident that, just as we can draw in a plane the nets of the five regular bodies, we ought to be able, by analogy, to model in three-dimensional space the solid nets of all the six structures of four-dimensional space corresponding to the five regular bodies. This has been done by Schlegel, the models being made by Brill, of Darmstadt. The figure corresponding to the square and cube may be described as follows. It is bounded by 8 cubes, just as the cube is bounded by 6 squares, it has 16 corners, 24 squares, and 32 edges, so that from every corner 4 edges, 6 squares, and 4 cubes proceed, and from every edge 3 squares and 3 cubes. Thus, reasoning by analogies, mathematicians have

gradually developed higher geometric systems and have succeeded in greatly extending the scope of geometry. The idea of higher dimensions has been brought somewhat into disrepute owing to the efforts of the followers of Professor Zollner, of Leipzig, to explain the phenomena of spiritualism by making the fourth-dimensional world the abode of spirits. Nevertheless, mathematicians agree as to the great practical value of the idea, inasmuch as it leads to important simplifications of mathematical language, and especially inasmuch as by its perfect generality it gives remarkable clearness to the concepts of real geometry. A reasonable mathematical treatment of the subject may be found in Schubert's essay on the "Fourth Dimension," in his *Mathematical Essays and Recreations* (Chicago, 1898), and in Manning, *The Fourth Dimension* (New York, 1910).

The phases of modern geometry are closely interwoven in their historic as well as in their logical development. Monge, the father of modern geometry, published his *Géométrie descriptive* in 1800, five years later the work of his pupil, Lacroix, appeared, *Essais sur l'enseignement en général, et sur celui des mathématiques en particulier*. Following his works were those of Hachette (1812, 1818, 1821), and later Leroy (1842), Olivier (1845), De la Gournerie (1860). In Germany leading contributors have been Ziegler (1843), Anger (1858), Fiedler (3d ed., 1883-88), and Wiener (1884-87). Monge did not confine his labors to descriptive geometry, he set forth the fundamental theorem of reciprocal polars, though not in modern language, gave some treatment of ruled surfaces, and extended the theory of polars to quadrics. Monge and his school concerned themselves especially with the theory of form, but Desargues, Pascal, and Carnot treated chiefly the metrical relations of figures. Carnot investigated those relations in particular connected with the theory of transversals, in his works *Géométrie de position* (1803), *Théorie des transversales* (1806). The present geometry of position (*Geometrie der Lage*) has little in common with Carnot's *Géométrie de position*.

Although Newton had discovered that all curves of the third order can be derived by central projection from five fundamental types, the origin of projective geometry is generally attributed to Poncelet (1822). He first made prominent the power of the projective relations, and the principle of continuity in research. Möbius followed Poncelet, making much use of anharmonic ratios in his *Barycentrischer Calcul* (1827). The anharmonic point and line properties of conics have been further elaborated by Brianchon, Chasles, Steiner, and Von Staudt. Plücker applied the theory of transversals to curves, and Salmon discovered the so-called circular points at infinity. Brianchon (1806) extended the application of Desargues's theory of polars. To Gergonne (1825-26) is due the principle of duality, the most important after that of continuity in modern geometry. Gergonne was the first to use the word "class" and explicitly defined class and degree (order), showing their dual relation. He and Chasles were the first to study scientifically surfaces of higher order. Steiner (1832) gave the first complete discussion of the projective relations between ranges and pencils and laid the foundation for modern pure geometry. In 1848 Steiner showed that the theory of polars can serve as a founda-

tion for the study of plane curves, independent of the use of coordinates. He introduced the noteworthy curves which now bear the names of himself, Hesse, and Cayley. Chasles, in his *Aperçu historique* (1837), popularized the new geometry and introduced the name "homographic" and extended the homographic theory. Von Staudt (1847, 1856-60) set forth a complete pure geometric system in which metric geometry finds no place. Cremona (1862, 1875), Townsend (1863), and Clifford did much to extend the knowledge of modern geometry.

Concerning the methods of geometric reasoning, see ANALYSIS.

GEOPH'AGY (from Gk γῆ, *gê*, earth + φάγειν, *phagein*, to eat), or EARTH EATING. The habit of eating clay or other earthy substances is widespread, having been noticed among the Indians of Bolivia and Peru, the Javanese, Persians, Hindus, Europeans, Africans, and certain inhabitants along the southern Appalachians in the United States. This habit is susceptible of a number of explanations. The Hopi Indians of Arizona, e.g., prepare the small tubers of the wild potato (*Solanum jamesi*) for eating by mixing them with clay, the object being to reduce the acidity of the root. The Dyaks take along with them in their canoes a supply of red ochre and oleaginous clay to eke out their rations, just as the Veddahs of Ceylon in time of famine eat decayed wood mixed with honey, in these cases the bulk of the food appeasing hunger by giving a sensation of fullness to the stomach.

Other earth eaters allege that clay improves the complexion, it undoubtedly imparts the ghastly sallowness declaring a clay eater. Deniker explains geophagy as perhaps due to the necessity of supplying the need of mineral substances which induces the eating of salt. It is probable that in the majority of cases the habit is due to morbid or nervous conditions, such as cause biting of the finger nails, chewing slate pencils, etc. The habit of geophagy is fatal, causing death by dysentery or dropsy.

GEOPHILOUS (jê-ôf'i-lûs) **PLANT**. See GEOPHYTE.

GEOPHYTE (from Gk γῆ, *gê*, earth + φυτόν, *phyton*, plant) A plant whose perennial organs live under or close to the ground. The term "geophilous" has been applied to such plants. The majority of geophytes have two distinct life aspects, corresponding to the periods of greater and lesser physiological activity. In the so-called growth period (summer in the higher latitudes,

GEOPHYTE

A spring beauty (*Claytonia*), showing the underground corm, the other (aerial) portions are present only a small part of the year.

the rainy season in arid low latitudes), geophytes are conspicuous landscape features, by reason of aerial organs of various kinds, such as aerial stems, leaves, flowers, in the so-called resting period, however (winter in the higher latitudes, the dry season in arid low latitudes), they are inconspicuous by reason of the relative absence of aerial organs. The most extreme geophytes are those whose organs are entirely beneath the soil during periods of lesser activity; examples of this class are bulbous plants (such as onions and lilies), plants with corms (such as Indian turnip and spring beauty), and

rootstock plants (such as sweet flag and bracken fern). In the cases cited the entire plant is often hidden from ordinary view during the resting season. One may also include in this category plants (like the carrot and dock) whose stems die down to the root at the close of a season of active growth, such plants usually have prominent roots. The geophytic habit is also shown, though to a less extreme degree, by ordinary lawn grasses and by clover, in these and in similar plants the perennating organs are close to the soil rather than beneath it. Biennials, such as mullein and evening primrose, have rosettes closely appressed to the soil in the winter or dry period, while in the growing period erect stems are sent up into the air. In most geophytes reserve foods are stored in the underground parts, and in many cases these parts are greatly enlarged, ordinary bulbs, roots like turnips and beets, and potato tubers illustrate this habit. The chief advantage of the geophytic habit in high latitudes is doubtless the attainment of protection from excessive cold and injuries consequent thereon, in arid regions protection from excessive transpiration is secured by a sojourn in the soil.

GEOPONIKI (a modern term, Lat. in form, based on a (hypothetical) Gk. form γεωπονική, *Geoponikē*, denoting those who have to do with working the soil, from γῆ, *gê*, earth, and νόσος, *ponos*, toil). A Greek term for the Greek and Roman writers on agriculture, a similar Latin term is *Scriptores Rei Rusticæ*. Among earlier Greek writers on agriculture may be mentioned Democritus, Aristotle, and Theophrastus, Xenophon praised Agriculture in his *Œconomical* and in his *Memorabilia*. Democritus' treatise, *Περὶ Γεωργίας*, *Peri Geōrgias*, was much used by later writers. Many Greek writers of the Alexandrian period dealt with agriculture, their names appear in the works of Varro and Columella, named below. (See also **GEOPONIKA**.) For the Roman attitude towards agriculture, see **AGRICULTURE**, **ROME**. Consult Cicero, *De Officiis*, I, 150-151, and Horace, *Carmina*, II, 15, with the notes of the editors on these passages. By order of the Senate the work of Mago the Carthaginian on agriculture was translated into Latin. Cato the Censor wrote a work called *De Agricultura*; Varro wrote *Rerum Rusticarum Libri Tres*. Vergil's *Georgics* ranks high in this field. See **HYGINUS**, **GAIUS JULIUS**, **COLUMELLA**, **PALLADIUS**, **RUTILIUS TAURUS**, **ÆMILIANUS**, **AGRICULTURE**. Consult the edition of the Roman *Scriptores Rei Rusticæ* by J. J. Schneider (4 vols., Leipzig, 1794-97, 3d ed., 1819-21), and Magerstedt, *Bilder aus der römischen Landwirtschaft* (5 vols., Sonderhausen, 1858-62).

GEOPONIKA (Gk. γεωπονικά, nom. pl. neut. of γεωπονικός, *geōponikos*, relating to agriculture). A Greek treatise on agriculture. It received its present form in the tenth century from an unknown hand, at the request of the Emperor Constantine VII (Porphyrrogenitus), to whom it is dedicated. The basis of this work was a compilation made in the sixth or early seventh century by a certain Scholasticus Cassianus Bassus, from the earlier works of Vindarius Anatolius, of Berytus, and Didymus, of the fourth or fifth century. Recent researches tend to show that the ultimate source of the work is the Latin translation of a treatise on agriculture by the Carthaginian Mago; this translation was made by Cassius Dionysius, of Utica, in the first century B.C. The names of some of the

earlier authors to whom reference is made are Africanus, Apuleius, Damogeron, Democritus, Diophanes, Florentinus, Leontinus, Pamphilus, Paxamus, the Quintili, Varro, and Zoroastrius. The 20 parts into which the treatise is divided contain a mass of rules and directions bearing on the daily life of the husbandman. Syrian, Arabian, and Armenian translations of this work are extant. The best editions are by Niclas (Leipzig, 1781) and Beekh (ib, 1895). Consult Krumbacher, *Byzantinische Literaturgeschichte* (Munich, 1897), pp 261 ff, and the works there referred to. Wellman, in *Hermes* (Berlin, 1908). See GEOPONICI.

GEORGE I (GEORGE LOUIS) (1660-1727). The first Hanoverian King of Great Britain and Ireland (1714-27). He was the son of Ernest Augustus, first Elector of Hanover, and Sophia, granddaughter of James I of England, and was born at Hanover on March 28, 1660. Entering the army at the age of 15, he distinguished himself by his bravery. His morals, however, were as loose as those of his contemporaries of equal rank, intrigues and mistresses made his marriage with his cousin, Sophia Dorothea, unfortunate. On the death of his father, in January, 1698, he became Elector of Hanover. When his mother, at an advanced age, was declared heiress to the throne of England by the Act of Settlement of 1701 George drew near to Marlborough and the Whigs, on whom he relied for the support of his claim. In 1705 he became Duke of Celle, and in 1706 his daughter was married to Frederick William of Prussia. At the death of Queen Anne he succeeded to the crown without difficulty and reached England Sept 18, 1714. Unlike William III, who had aimed to reconcile opponents by calling men of both parties to the ministry, George, a far inferior man, employed Whigs only as advisers. Utterly ignorant of English character and even of the language, and lacking sympathy with his new subjects, he aimed to exploit England for the benefit of his German electorate. Another ground for his unpopularity was the greed of his favorites and mistresses, who sold offices, great and small. George had little to do personally with the government, which was carried on by his ministers—at first by Stanhope and Townshend and later by Walpole. The Jacobite insurrection of 1715 was easily suppressed, the leaders were put to death, and about 1000 rebels were transported to the plantations. After this event George's frequent visits to Hanover made him still more unpopular, and even while he was in England he rarely attended the cabinet, as he could not understand the discussions. For these reasons power came rapidly into the hands of Walpole. During one of the absences (1720), the South Sea bubble burst, and the misfortune was naturally laid at the King's door, the company was alleged to have paid great bribes to the Duchess of Kendall, his favorite mistress. Thereupon some advised George to abdicate in favor of the Prince of Wales, others urged him to seize absolute control of the government. Without permitting him to resort to either expedient, Walpole, supported by Townshend, brought the government safely through the crisis. Sometime afterward the demand of Spain for the restoration of Gibraltar and of Minorca (1725) led to a short war with that country. Admiral Hosier commanded an unsuccessful expedition to the Spanish possessions in America (1726), but in 1727 peace was

signed. The King died of apoplexy on a journey to Hanover on June 11, 1727. He had two legitimate children—George, who succeeded him, and Sophia Dorothea. Commonplace in ability as well as in personal appearance, George nevertheless gave England a wise foreign policy, and though he was by nature autocratic, the circumstances of his reign favored the growth of constitutional principles.

GEORGE II (GEORGE AUGUSTUS) (1683-1760). King of Great Britain and Ireland, Elector of Hanover (1727-60). The son of the preceding he was born at Herrenhausen, Hanover, Nov 10 (N S), 1683. After his mother's divorce in 1694, he lived with his grandparents, who superintended his education. On Sept 2, 1705, he married the Margrave of Anspach's daughter, Carolina Wilhelmina. His code of morals was on a par with his father's, but his wife gained considerable influence over him by condoning his infidelities, and her death, in 1737, which was considered a national loss, he genuinely deplored. In 1708 he joined Marlborough's army and showed conspicuous bravery at Oudenarde, where he narrowly escaped death. At his father's accession to the throne he was created Prince of Wales. Owing to his affection for his mother, he had never been on good terms with his father, who connived at a plot for his forcible disappearance. Their mutual repugnance increased when the King, during his visits to Hanover, was averse to appointing the Prince guardian of the realm. The Prince supported the opposition party, but at his father's death, in 1727, was persuaded by the Queen to retain Walpole in power. Walpole's administration was distinguished by the preservation of peace, and his unwillingness to declare war with Spain led to his resignation in 1742. He was succeeded by Carteret, who favored a war policy. Anxious for the safety of Hanover, the King made an alliance with Maria Theresa of Austria in the Silesian Wars, and at Dettingen, in 1743, commanded the victorious army in person. The Young Pretender's rebellion in 1745-46 was suppressed at Culloden by the Duke of Cumberland, the King's second son. England joined Prussia in the Seven Years' War, which brought about the downfall of the colonial power of France. In 1757, by the victory of Plassey, Clive laid the foundations of the Indian Empire, and in 1759 Wolfe's victory on the heights above Quebec achieved the conquest of Canada. In 1749 the funds rose above par, and Pelham effected an appreciable reduction of the national debt by reducing the interest from 4 to 3 per cent. George II, although a mediocrity and possessed of an obstinate temper, was always sagacious enough to perceive the superior wisdom and prudence in the counsels offered by his ministers and acceded to their ad-

vice, to the material benefit and industrial progress of the country. At the end of his reign Pitt conducted the affairs of the nation. George II died suddenly from rupture of the heart, Oct 25, 1760, at Kensington. Consult Hervey, *Memoirs of the Reign of George II* (London, 1854), Walpole, *Memoirs of the Last Ten Years of the Reign of George II* (ib., 1822, 1846), Schmucker, *History of the Four Georges* (New York, 1860), Thackeray, *Four Georges* (London, 1861), McCarthy, *History of the Four Georges and William IV* (ib., 1884-1901), Jesse, *Memoirs of the Court of England from the Revolution of 1688 to the Death of George II* (ib., 1843), Cox, *Memoirs of the Life and Administration of Sir Robert Walpole* (ib., 1798), id., *Memoirs of Horatio, Lord Walpole* (ib., 1802), Wilkins, *Caroline the Illustrious* (New York, 1904), Lucas, *George II and his Ministers* (London, 1910).

GEORGE III (GEORGE WILLIAM FREDERICK) (1738-1820). King of Great Britain and Ireland (1760-1820). He was born on June 4, 1738, and succeeded his grandfather, George II. His father was Frederick Louis, Prince of Wales, and his mother was Augusta, daughter of the Duke of Saxe-Gotha. His early education was the occasion of much quarreling between his father and grandfather and suffered in consequence. After his father's death, in 1751, he was kept in seclusion and educated in a very narrow way by his mother and her favorite counselor, the Earl of Bute. He learned to speak French and German, but knew little Latin and less Greek. His English was poor in conversation and worse in writing. He spelled badly and had no taste for literature. Nevertheless, he began the famous collection of books and manuscripts which, under the name of King's Library, is one of the greatest treasures of the British Museum, and he had a genuine appreciation of music.

George III had but average ability, but more than average obstinacy. Although a great stickler for formalities and royal dignity, he was simple and economical in his tastes, which were emphatically those of the middle class. He had a taste for farming and was fond of petty mechanical contrivances, and was often derisively called "Farmer George" and "the royal button maker." He was sincerely pious and, unlike his immediate predecessors and successors, was highly moral. He married in 1761 the Princess Charlotte Sophia, daughter of the Duke of Mecklenburg, and became the father of 15 children. He was a man of great courage and in moments of danger preserved the greatest dignity. At the time of the Lord George Gordon riots his was the only clear head in the Council, and it was by his advice that the riots were suppressed.

George III was perhaps the most important figure in the British constitutional development of the eighteenth century. In his boyhood his mother had instilled exalted notions of the royal prerogative into his mind. The Earl of Bute, too, emphasized these tendencies. His plan was to do away with the party system as it then existed, and to resume the powers of the crown which had been appropriated by the cabinet ministry. From the time of the accession of the house of Hanover the Whig oligarchy had controlled Parliament, and by their chosen ministers ruled the King. George III designed to break up this oligarchy and to make himself the ruler. He differed from the Stuarts in that

he proposed to rule constitutionally, with the consent of Parliament, and from the Pitts in that he wished to overthrow the oligarchy by exercise of the royal power, instead of appealing to public sentiment. He reassumed the crown patronage which had passed into the hands of the cabinet and by it organized a group of politicians upon whom he could depend. The "King's friends" thus became an important factor in politics. He did not hesitate to use corruption to gain his ends, both in general elections and in securing parliamentary votes, according to the custom of his age. Although at times the nation disapproved of his policy, yet in the main it supported his measures and the Whig oligarchy was finally broken.

The history of the reign of George III is a description of the struggle he made to put his political theories into practice. After the fall of Pitt, under whom England had entered upon a brilliant career of victory and conquest in the Seven Years' War, he succeeded in 1761 in introducing some of his own friends into the Whig ministry of Newcastle, and on the retirement of the latter in the following year he made Bute, his favorite, Prime Minister. But there was great prejudice against Bute, on account of his Scottish nationality and well-known opinions on the royal prerogative. He was not a man of sufficient ability to overcome this prejudice and, recognizing his failure, resigned in 1763. Meanwhile the Whig party had broken into three factions, and the King invited George Grenville, the leader of those whose opinions differed least from his own, to form a new cabinet. He approved of the prosecution and exile of the Radical leader Wilkes by Grenville, and the Stamp Act (1765) taxing the American Colonies. But being unable to tolerate Grenville's rudeness and dictatorial attitude, he dismissed him and reluctantly admitted the Rockingham ministry, which represented the most liberal of the Whig factions and the only English party that made no use of parliamentary corruption. Their liberal measures, notably the repeal of the Stamp Act, displeased the King, and in 1766 he invited Pitt, whom he made Earl of Chatham, to form a cabinet. Pitt's cabinet was formed, but the King's plans were frustrated by the failure of the Prime Minister's health. During the ministry of Grafton that followed, the King approved of Townshend's duties levied in 1767 on certain goods imported into the American Colonies and also of the exclusion of Wilkes from the House of Commons, although the attitude of the House was in opposition to the best political and legal thought of the day. On the resignation of Grafton he at last found in Lord North a minister after his own heart. North honestly agreed with the King's ideas and tried to carry them out. He was firm and able, seldom gave offense, and had great tact for managing parliamentary majorities. During his long ministry (1770-82) the King virtually directed political affairs, as his correspondence with Lord North shows (ed. by W. B. Doane, London, 1867). Throughout the American War, of which he was strongly in favor, his wishes controlled the ministry, the Commons being a mere instrument in his hands. After the French-American alliance he alone wished to continue the war, refusing to allow Lord North to resign. When at last the inevitable resignation came, he contrived to break up the second Rockingham ministry, through the influence of Shelburne. On the downfall of the

Shelburne ministry he defeated by his personal efforts the combination ministry of Fox and North. In the face of a hostile majority he appointed the younger Pitt as Prime Minister, and the electors signified their approval by returning a Tory majority to Parliament.

Although Pitt was by no means subservient, there was no friction between him and the King, who approved most of his measures. George was strongly in favor of the long and ruinous war with France, and of the union which Pitt forced upon Ireland in 1801. He was opposed, however, to Pitt's attempted parliamentary reform in 1785 and to the impeachment of Warren Hastings, which measures were, after all, defeated. He refused to allow the cabinet to appoint the bishops, as had become the custom, and in the case of Archbishop Sutton of Canterbury took the appointment directly out of Pitt's hands. He refused positively to grant Catholic emancipation, which he conceived to be contrary to his coronation oath, and in 1801 forced Pitt to resign rather than allow his promise of emancipation to the Irish Catholics to be fulfilled. In 1804 he dismissed the entire Addington ministry because its members refused to pledge themselves never during his life to advocate Catholic emancipation. His dislike of Fox, who he supposed had a bad influence on the Prince of Wales, is well known. He repeatedly refused to allow him to enter the ministry (1781, 1782, 1803, 1804, 1806), "even at the hazard of a civil war." This dislike he lived to overcome, and he much regretted the death of Fox.

The King's last years were darkened by many troubles, keenest of which was the conduct of his brothers and of his children, particularly the Prince of Wales, whose immoral and undutiful behavior embittered his life. He had to bear the brunt of popular ill feeling occasioned by the economic misery the French War brought to England. He was also afflicted by sickness. In 1805 he had trouble with his eyes, and by 1809 he became blind. As early as 1765 he was mentally deranged for a short time. In 1788 there was a recurrence of the same trouble, and the first Regency Bill was passed, but he speedily recovered. In 1811, soon after the death of his favorite daughter, Amelia, he finally became hopelessly insane, and his son (afterward George IV) acted as Regent until the King's death, on Jan. 29, 1820.

Bibliography. *The Calendar of Home Office Papers of the Reign of George III*, ed. Paddington (Rolls Series, London, 1878), is the most important source. Russell (ib., 1842), that of William Pitt, ed. by Taylor and Ringle (ib., 1840); of Lord Harris Malmesbury (ib., 1844); of Lord Charles Cornwallis, ed. by Ross (ib., 1859), and especially *The Works and Correspondence of Edmund Burke*, Bohn Library (ib., 1857). Among contemporary memoirs, consult: Walpole, *Memoirs of the Reign of George III* (ib., 1894); *Memoirs of the Marquis of Rockingham and his Contemporaries*, ed. by Thomas (ib., 1852). Especially important politically are the *Letters of Junius* (ib., 1806; also published in the Bohn Library), usually ascribed to Sir Philip Francis. **HISTORIES.** Adolphus, *History of England from the Accession to the Decease of George III* (London,

1840), Massey, *History of England during the Reign of George III* (ib., 1855), Lecky, *History of England in the Eighteenth Century*, vols. III-VI (ib., 1878-90), May, *Constitutional History* (New York, 1865), begins with this reign. Consult also Trevelyan, *George III and Charles Fox* (ib., 1912).

GEORGE IV (GEORGE AUGUSTUS FREDERICK) (1762-1830) King of Great Britain and Ireland (1820-30). The eldest son of George III, he was born in St. James's Palace, Aug. 12, 1762, and was created Prince of Wales five days afterward. He was well educated and strictly disciplined, but displayed an ungovernable temper, and on attaining his majority became notorious for his profligacy and extravagance. He contracted a marriage with Mrs. Fitzherbert, Dec. 15, 1785, but in 1787, to obtain parliamentary assistance for his debts, he allowed Fox to deny the marriage in Parliament. On April 8, 1795, again to liquidate his debts, he married his cousin, Caroline Amelia Elizabeth, of Brunswick (qv). They had one daughter, the Princess Charlotte Augusta, born Jan. 7, 1796, who married Prince Leopold, afterward King of Belgium, but died in childbirth, Nov. 6, 1817. George deliberately deserted his wife shortly after his daughter's birth, and his conduct towards her, his attempts to procure a divorce, his numerous mistresses, and general behavior, made him extremely unpopular, notwithstanding his cleverness, versatility, and gracious manner, which among a certain class of associates earned him the title of "the first gentleman in Europe." From a spirit of antagonism he supported the Whig opposition, and his father's insanity was partly due to his misconduct. He became Prince Regent in 1811, and King at his father's death, on Jan. 29, 1820. The Napoleonic wars, the War of 1812-15 with the United States, the aid rendered to the Greeks by the British fleet in the battle of Navarino (1827), which secured the independence of Greece, and the passing of the Roman Catholic Emancipation Bill (1829), are the notable events of his reign. He died at Windsor, June 26, 1830. Consult McCarthy, *History of the Four Georges and of William IV* (4 vols., London, 1884-1901), Thackeray, *Four Georges* (ib., 1861), Lady Bury, *Diary of the Times of George IV* (ib., 1838), Croly, *Life of George IV* (ib., 1830), Huish, *Memoirs of George IV* (ib., 1830), Holland, *Memoirs of the Whig Party* (ib., 1854), Fitzgerald, *Life of George IV* (ib., 1881), Melville, *The First Gentleman of Europe* (ib., 1906), Wilkins, *Mrs. Fitzherbert and George IV* (ib., 1908).

GEORGE V (GEORGE FREDERICK ERNEST ALBERT) (1865-) King of Great Britain and Ireland and of the Dominions beyond the Seas and Emperor of India. The second son of Edward VII, he was born at Marlborough House, London. He entered the navy in 1877, studied at Greenwich, and became lieutenant in 1885 and captain in 1893, rear admiral in 1901 and vice admiral in 1903. After the death of his elder brother, Albert Victor, Duke of Clarence, in 1892, he was made Duke of York. In 1893 he married Princess Victoria Mary of Teck, who had previously been engaged to his brother Albert Victor. She bore him five sons and a daughter: Edward, Prince of Wales (1894), the princes Albert (1895), Henry (1900), George (1902), and John (1905); and Princess Mary (1897). Upon the accession of Edward VII

(1901) he received the title of Duke of Cornwall, made a journey around the world, in the course of which he visited all the great British colonies, and on his return in November was created Prince of Wales. In 1905-06 he made a tour of India. On the death of his father, in 1910, he succeeded to the throne as George V, his wife taking the style of Queen Mary. They were crowned June 22, 1911, in Westminster Abbey, visited India and held a durbar on Dec 12, 1911, and in February, 1912, returned to England. The change made in a "republican" paper, the *Liberator*, by Edward Mylius that in 1890, before he became Duke of York, King George had married secretly in Malta a daughter of Sir Michael Culme-Seymour was disproved in 1911 in a trial for libel, in which the King wished to take the witness stand. Although the new court soon showed itself stricter and more old-fashioned than King Edward's had been, King George had become popular as the "Sailor Prince," who as early as 1901 had made a vigorous speech from the text "Wake up, England." Even the heroic measures by which the Parliament Bill of 1911 was forced through under threat that the King would create peers to give effect "to the decision of the country" did not affect the popularity of the crown. Consult Robert Hudson, *Our Sailor King* (London, 1911), H F Burke, *Historical Record of the Coronation* (ib, 1912), J W. Fortescue, *Narrative of the Visit to India of their Majesties, King George and Queen Mary* (ib, 1912). See WAR IN EUROPE.

GEORGE I (1845-1913). King of Greece from 1863 to his death in 1913. He was the second son of King Christian IX of Denmark and served for some time in the Danish navy. After the deposition of King Otto in 1862, the National Parliament in the following year conferred the crown on Prince William of Denmark, as George was then called, who, with the concurrence of his own family and the consent of the Great Powers, ascended the throne of Greece as George I. He was married at St Petersburg to Princess Olga, daughter of Grand Duke Constantine, Oct 27, 1867. He consistently pursued a Panhellenic attitude, as shown especially in the war with Turkey (1897). After carrying on a war with his ancient enemies, the Turks, to a successful conclusion (1911-13), King George I was assassinated at Salonika, March 19, 1913. See GREECE, BALKAN WAR.

GEORGE V (1819-78). The last King of Hanover. He was the son of Ernst August (qv), and grandson of George III of England. When he ascended the throne in 1851, on the death of his father, he was afflicted with blindness. As a result, he fell into the hands of unwise and unscrupulous advisers. He was a bitter foe to Prussia and joined Austria against her in 1866. After Austria's defeat Hanover became a part of Prussia, and King George went to Vienna and then to Paris, where he continued to agitate against Prussia. In 1868 he relinquished his claims to Hanover for the sum of 16,000,000 thalers, but his enmity to Prussia declared itself so strongly that the sum was not paid, but was held by the government as the "Guelph Fund" (qv).

GEORGE (1832-1904), King of Saxony. He was the youngest son of King John (1801-73), entered the army in 1846, studied at Bonn in 1849-50, fought in the War of 1866 against Prussia, and was corps commander in the

Franco-German War. He succeeded his brother Albert June 19, 1902, and died Oct 15, 1904. His eldest son, Frederick Augustus, followed him on the throne.

GEORGE II (1826-1914). Duke of Saxe-Meiningen and Hildburghausen, born at Meiningen, a son of Duke Bernhard II. He was educated at Bonn and Leipzig, and succeeded upon the resignation of his father in 1866. He was a patron of the drama and advanced histrionic art by organizing, with the assistance of his intendant and manager, Ludwig Chronegk, a troupe of actors who played in Europe and America. He married in 1850 Charlotte, Princess of Prussia, who died in 1855, in 1858, Feodore of Hohenlohe-Langenbourg, who died in 1872, and in 1873,morganatically, Helene Franz, who received the title of Baroness von Heldburg. His son Prince Frederick was killed at the siege of Namur, Aug 23, 1914.

GEORGE (1653-1708). Prince of Denmark and husband of Queen Anne of England. He was the son of Frederick III of Denmark. By Anne, whom he married in 1683, he had 17 children, all of whom died before their mother became Queen of England. Prince George was devoid of talent and ambition, but was brave and humane. Through his wife's influence he deserted James II in the hour of need. After the triumph of the Prince of Orange, Prince George was naturalized and created Duke of Cumberland. He was present at the battle of the Boyne, and when his wife ascended the throne he was created Lord High Admiral.

GEORGE, called THE BEARDED (1471-1539). Duke of Saxony. He was the eldest son of Albert the Brave, founder of the Albertine line of dukes. He received a theological education at Meissen and Leipzig and succeeded his father in 1500. He was a son-in-law of King Kasimir of Poland. He was a good ruler, kindly and accessible to his subjects. Though he agreed with Luther as to the need of reform in the Church, the Duke did not acquiesce in the change in dogma advanced by him, and he soon became an ardent opponent of the Reformation, especially after the famous debate between Luther and Eck at Leipzig in 1519. Consult Welck, *George der Bartsge* (Brunswick, 1900).

GEORGE, called PISIDA, "the Pisidian." A prominent churchman and historical and religious writer of Constantinople in the seventh century. He held various offices in the "Great Church" (of St Sophia) and is thought to have accompanied the Emperor Heraclius on his expedition against the Persians (622 A.D.). He was the author of many poems of an historical or religious character, in which he celebrated the wars of Heraclius and discussed the theological questions of the day, these are to be found in Migne, *Patrologia Græca*, vol xcii (Paris, 1854-66). Consult Sternbach, in *Wiener Studien*, vols xiii-xiv (Vienna, 1891-92), id, *De Georgii Pisidæ apud Theophanem aliosque Historicos Reliquis* (Cracow, 1899).

GEORGE, DAVID. See DAVIDISTS, JORIS, DAVID.

GEORGE, FREDERICK WILLIAM ERNEST (1826-1902). Prince of Prussia, general, and author. He entered the Prussian army in 1836, was advanced to the rank of lieutenant general in 1860, and subsequently became general of cavalry (1866). Of his numerous dramatic works, published under the name of G Conrad, several have been publicly performed and are still some-

times played. They include *Wo liegt das Glück?* (1877), *Don Sylvio* (1877), *Elektra* (1877), *Yolanthe* (1877), *Medea* (1877), *Sappho* (1887). Some of these were collected in four volumes (1870). He also wrote on economics and politics. Consult the sketch by Von Olfers in vol. vi of the *Hohenzollern-Jahrbuch* (Leipzig, 1903).

GEORGE, GRACE (1880-). An American actress. She was born in New York City, where she made her debut in *The New Boy* in 1894. She first starred in *The Princess Chiffon* (1899) and afterward in *Her Majesty* (1900); *Under Southern Skies* (1901-02), *Frou-Frou* (1903), *Pretty Peggie* (1903-04), *The Two Orphans* (1904). She made a great success in the rôle of Cyprienne in *Duorçons* in both New York and London in 1907, and she reappeared in the same play in 1913. She also played in *Sylvia of the Letters* (1909), *A Woman's Way* (1909), *Just to Get Married* (1911-12), *The Earth* (1912), *Barrie's Half an Hour* (1913); and a revival of Clyde Fitch's *The Truth* (1914). Consult William Winter, *The Wallet of Time* (2 vols., New York, 1913).

GEORGE, HENRY (1839-97). An American economist, born in Philadelphia, Pa. When 14 years old, he was forced to leave school and to seek work in order to support himself. After shipping as foremast boy on a vessel bound for Melbourne and Calcutta, he learned the printer's trade and in 1858 worked his way to California. At this time the excitement attending the discovery of gold in Fraser River, British Columbia, was at its height, and Henry George worked his way to Victoria on a sailing vessel. After enduring many privations he returned to San Francisco, where he found work in a printing office. As the business of the printing office grew slack, he secured a position in a rice mill. For the next few years he drifted from one employment to another, always in financial straits, due to no lack of energy on his own part. In 1861, in company with five other printers, he undertook to publish a daily newspaper, the *Evening Journal*, but this venture also proved unsuccessful. In 1865 he began to write for the press. He was soon engaged as a reporter on the *San Francisco Times*, where he was quickly promoted to the position of chief of staff. In 1866 he wrote a letter to the *New York Tribune* attacking the Central Pacific Railroad and the Wells, Fargo Express on the ground of their monopolistic extortions. In 1869 he wrote for the same paper a letter on the Chinese question, which gained the warm commendation of John Stuart Mill. The great fortunes acquired in California through the rapid increase in the value of land fixed his attention upon the land problem, and in a pamphlet published in 1871, entitled *Our Land Policy*, he advanced most of the ideas that later appeared in *Progress and Poverty*—that the value of land represents in the main a monopoly power, and that the entire burden of taxation should be levied upon it, thus freeing industry from taxation and equalizing opportunities by destroying monopoly advantage.

Progress and Poverty, George's most important work, was first published in 1879. At first it attracted little attention and found few buyers, but in a few years it attained extraordinary popularity, especially in England, where the Irish land problem was the burning question of the day. Interest in the book increased

at home, and by 1883 Mr. George found himself regarded as the apostle of a new social creed. From this time his activities were engaged chiefly in lecturing both in America and in the United Kingdom and in writing articles for papers and magazines on the land question and on other economic and political subjects. His literary activities brought him but little pecuniary return, and he remained in straitened circumstances until the end of his life. In 1886 George became a candidate for the mayoralty of New York City, but was defeated by Abram S. Hewitt. In 1897 he again ran for mayor, but died before election day.

The chief contributions of Henry George to economic science are to be found in *Progress and Poverty*. *The Science of Political Economy*, published after his death, contains little that is of value. The main theses of *Progress and Poverty*, that economic progress is marked by increasing extremes of wealth and poverty, resulting from the tendency of rent to absorb all values above minimum wages and interest, and that the confiscation of rent through a single tax on land would restore democratic equality and universal prosperity, have not received acceptance from scientific writers. But the theory of wages which he advanced in opposition to the prevailing "Wages Fund Doctrine"—that the laborer is paid, not out of capital, but out of the value which he himself creates—has been adopted by some of the most important economists of the day. See **SINGLE TAX**, and consult George, *The Life of Henry George* (New York, 1905).

GEORGE, JAMES ZACHARIAH (1826-97). An American legislator, born in Monroe Co., Ga. After serving in the regiment known as the Mississippi Rifles during the Mexican War, he devoted himself to the study of law. Soon after the secession convention in Mississippi he enlisted in the Confederate army and eventually rose to the rank of brigadier general. As chairman of the executive committee of the Democratic party in 1875 he was a conspicuous factor in the political agitation of that period. He was appointed Chief Justice of Mississippi in 1879 and was a member of the United States Senate from 1881 until his death. He was distinguished alike as jurist and statesman and during his career in the Senate displayed exceptional oratorical ability and unusual power of logical reasoning. He was probably the most influential member of the State Constitutional Convention of 1890. He published *Reports of the Mississippi Supreme Court* for 1856-60 and a *Digest* of the same court for 1818-72. The infirmity of the State Agricultural and Mechanical College bears his name.

GEORGE, LAKE. A lake in eastern New York, lying in Warren, Washington, and Essex counties, near the border of Vermont (Map: New York, G 3). It is about 33 miles long from south to north, and from about $\frac{3}{4}$ to about 3 miles wide, generally shallow, but in some places very deep. It is connected with Lake Champlain on the north. Lake George is one of the most beautiful of the lakes of the United States. Its waters are singularly clear, it is dotted with charming islands, and the surrounding scenery, with the closely encompassing foothills of the Adirondack Mountains rising to a maximum altitude of 2665 feet (Black Mountain, near the eastern shore), is most picturesque. Great historical interest attaches to it in events connected with the French and Indian

War and the War of the Revolution, especially the battle of Lake George (1755), which is commemorated by a monument in the Fort George Battle Park, of 35 acres, a State reservation. The lake was discovered in 1642 by the Jesuit Father Jogues and was named by him Lac Saint-Sacrement. In 1775 it was given its present name in honor of King George III. Consult "Lake George" in *Harper's Magazine*, vol. lxx (1879), for a description of the scenery about the lake and its historical associations, also, Reid, *Lake George and Lake Champlain* (New York, 1910).

GEORGE, SAINT (?-303). The patron saint of England. Little is known of his life, the reports concerning him being largely legendary. Although frequently confounded (as, e.g., by Gibbon) with George of Cappadocia, the Arian leader, he lived at an earlier period than the latter. He is said to have been a person of consequence, born at Lydda or at Ramleh, Palestine, and educated in Cappadocia, who embraced Christianity, attained high rank under Diocletian, and suffered martyrdom in Nicomedia in April, 303. His festival (Roman) is April 23. He was extremely popular with the English Crusaders and was adopted as the tutelary saint of England during the reign of Edward III, although the Council of Oxford in 1222 had decreed that his feast should be a national one. He is also the patron of Russia and Portugal. Churches and religious establishments have borne his name from the earliest times. He is venerated not only by the Western and Eastern churches, but also by the Mohammedans as Ghargis, or El Khouder. The red cross of Saint George on a white ground was long worn as a badge by the English soldiery and is now displayed on the Union Jack. The story of the combat between St. George and the Dragon first appears in the Middle Ages in the *Legenda Aurea* of Jacobus de Voragine, it may owe something to the fact that Lydda was near the scene of Perseus' rescue of Andromeda, or to an allegorization of Diocletian as a dragon. Consult Budge, *The Martyrdom and Miracles of St. George* (London, 1888), Coptic texts and versions, Flemming, *St. George of England* (New York, 1901), Huber, *Zur Georgslegende* (Erlangen, 1906), Gordon, *Saint George* (London, 1907), Bulley, *St. George in Merrie England* (ib., 1908), and, of utmost importance, Delehaye, *Les légendes grecques des saintes militaires* (Paris, 1909).

GEORGE, WILLIAM REUBEN (1866-). An American, known as the founder of the George Junior Republic. He was born at West Dryden, N. Y., was educated in the public schools, and moved to New York City in 1880, where he engaged in business. In 1890-94 he took large parties of boys and girls to spend vacations with him. In 1894 he instituted the plan of requiring the children to work for what they received and also introduced self-government among them, and in the following year this plan was developed into the "George Junior Republic," at Freeville, N. Y. For a consideration of the further relations of Mr. George to the Republic, see *GEORGE JUNIOR REPUBLIC*.

GEORGE-A-GREENE, THE PINNER OF WAKEFIELD. A comedy (1595), ascribed to Robert Greene on the evidence of certain obscure and contradictory manuscript notes on the title-page of a copy now in possession of the Duke of Devonshire. At any rate, the reputed author acted the part of the Pinner. The sources are

an early prose romance entitled *The History of George-a-Greene* and a ballad called *The Jolly Pinder of Wakefield with Robin Hood, Scarlet, and John*.

GEORGE BARN'WELL, OR, THE LONDON MERCHANT. A bourgeois tragedy in prose, by George Lillo, produced at Drury Lane, June 22, 1731. Consult Cibber's *Life of Lillo*.

GEORGE EL'IOT. The pseudonym of Mary Ann Evans, the English novelist. See *ELIOT, GEORGE*.

GEORGE FREDERICK, PRINCE OF WALDECK. A German soldier. See *WALDECK, GEORG FRIEDRICH*.

GEORGE JUNIOR REPUBLIC. A community of boys and girls near Freeville, N. Y., about 9 miles east of Ithaca. It was founded in 1895 by William R. George, of New York, for the purpose of affording neglected, reckless, and unfortunate children an opportunity to acquire the qualities necessary for their future welfare in life, and was the outcome of an experiment which Mr. George had been conducting for some years by taking every summer from 150 to 250 children of the slums to spend their vacation with him at his country home.

The constitution of the miniature republic is modeled upon that of the United States, with elective officers, a legislature (first a town meeting and later two branches), a judicial system, and administrative machinery. At first Mr. George was president, with adults in the higher offices, but since 1896 the boys have filled all offices. Each citizen was obliged to work or starve, he could work for Mr. George for six hours a day, or for citizen contractors, who purchased licenses for the different kinds of business from Mr. George, or in the school. Nothing could be obtained in the community except by purchase in the citizens' own tin coin (now aluminium), which at the end of the summer was redeemed in United States money, or supplies to take home. In the first year a number of practical questions were met by the youthful legislators: a depreciated currency, a tariff question, woman's suffrage, and a trust among hotel proprietors. Much criticism has been directed against the republic from the beginning on account of the great latitude granted to its immature citizens in enacting and administering the laws. In particular it has been charged that excessively long prison sentences are imposed, and the New York charitable authorities have insisted that the constitution be modified so as to place penal authority in the hands of adults. Mr. George and his disciples insist that any curtailment of responsibility must inevitably reduce the educational value of the institution.

The original purpose of the institution was to provide for the rehabilitation of boys and girls who had fallen into delinquency through the influence of an unwholesome environment. Later Mr. George concluded that life in the community would be good for other youths as well. Some children of well-to-do parents have been placed in the institution simply to secure the benefits of its wholesome training in independence. The republic does not admit defectives knowingly. In some instances mental defectives have been harbored in the republic, to its injury, and without benefit to themselves. Children from any part of the United States may be consigned to the guardianship of the trustees by parents or public authorities. The age of admission is 12 to 18 years. The republic

lic has a number of buildings, with simple accommodations which are used for school, government purposes, workshops, hotels, restaurants, store, bank, and library. The kinds of work carried on under efficient directors are farming (the trustees own or control a little over 300 acres), carpentry (the boys put up new buildings), printing, dressmaking, scientific cooking, domestic service, bread and wafer baking, furniture manufacture, and plumbing. The institution also operates a laundry. All children under 16 must attend the republic's primary and grammar school.

The success of the George Junior Republic soon attracted attention throughout the country. In 1897 Mrs. William T. Carter, after a visit to the republic, established a similar institution at Reddington, Pa., known as the William T. Carter Junior Republic. In 1899 citizens of Washington and Baltimore established the National Junior Republic at Annapolis Junction, Md. In 1904 the Connecticut Junior Republic was organized at Litchfield, Conn. These organizations, although in close communication with the George Junior Republic, were entirely independent of it. In 1908 representatives from these republics met at the invitation of Mr. George and founded the National Association of Junior Republics, of which Mr. George was made director. The object of the association is to correlate the activities of the several organizations and to work towards the establishment of new organizations. After the formation of the association junior republics in affiliation with it were established at Chino, Cal., Flemington, N. J., Grove City, Pa., Moorestown, N. J., and Dorset, England. After the extension of the Junior Republic movement to other towns and the formation of the National Association of Junior Republics the connection of Mr. George with the Junior Republic at Freeville became essentially that of unofficial adviser. In 1913 serious criticisms of his methods of conducting the Republic were brought by the State Board of Charities, and a committee of investigation, with *personnel* accepted by both George and his critics, while absolving the institution's founder of the charge of personal wrongdoing, censured severely certain of his methods in dealing with citizens of the Republic suspected of delinquency. In 1914 the recurring deficits in the Republic budget led to a decision on the part of the trustees to close the institution. An offer of Mr. George to take the institution under his charge was accepted.

GEORGE OF CAPPADOCIA. Arian Archbishop of Alexandria, 356-361. He was a native of Epiphania, in Cilicia, yet he is always called a Cappadocian, though such only by ancestry. Our knowledge of him comes from his adversaries, who load his early life with slanders. He seems to have lived for some time at Constantinople. It is not known when or how he obtained ecclesiastical orders, but in 356 he

turns up as Bishop of Alexandria after the banishment of Athanasius. He had the support of the Arian faction and the Emperor Constans. His cruelty and oppression were such that a rebellion broke out, and he had to flee for his life. He was restored by a military demonstration, but did not mend his ways. A few days after the accession of Julian the populace arose en masse, dragged him out of prison, where he had been placed by the magistrates for safety, paraded him with every indignity through the streets on a camel, burned his dead body, and cast the ashes into the sea. He is represented as ignorant not only of the Scriptures and theology, but even of letters. Yet it is said he owned a fine library which Julian had preserved for his own use. He is not to be confused, as Gibbon has done, with St. George, the patron of England.

GEORGE OF TREBIZOND (c. 1396-1484). A scholar famous in connection with the revival of the study of Greek in Italy. He was born in the isle of Crete, but was descended from a family of Trebizond. A noble Venetian, Francesco Barbaro, invited him to Venice, where he became professor of rhetoric and philosophy. As secretary to Pope Eugenius IV and later to Pope Nicholas V, he occupied a conspicuous position at Rome as a Greek scholar and as a translator of Greek authors into Latin. The inaccurate character of his work provoked the criticism of contemporary scholars, especially of Cardinal Bessarion. He was an ardent advocate of the Aristotelian system of philosophy and engaged in controversy with his contemporary, the Platonic philosopher, Gemistus Pletho. Among his writings are *Rhetorica* (1470) and *Comparationes Philosophorum Platonis et Aristotelis* (1523). Consult Fabricius, *Bibliotheca Græca*, ed. by Starles, vol. XII (Hamburg, 1790-1809), and Voigt, *Die Wiederbelebung des Classischen Altertums* (2d ed., 2 vols., Berlin, 1893).

GEORGES, zhôrz, MARGUERITE JOSÉPHINE WEIMAR, known as Mademoiselle Georges (1787-1867). A French tragic actress of great beauty and talent, born at Bayeux. When she appeared at the Théâtre Français in 1802 as Clytemnestra, she made an unusual sensation. In 1808 she suddenly deserted her position and went to Russia. She played before Napoleon at Dresden in 1812, however, and in 1813, under the patronage of Hortense, was allowed to return to the Comédie Française, but left that stage definitely in 1816. Talma was one of her teachers. She devoted herself upon the stage to the Romantic movement led by Victor Hugo and the elder Dumas, and in their works won some of her greatest triumphs. Among her famous rôles were Dido, Semiramis, Lucrezia Borgia, and Marie Tudor. She left the stage in 1849. Her later years of retirement were unhappy, largely through the caprices that had marred her career and the comparative poverty which ensued.

GEORGE SAND, Fr. pron. zhôrz sand. See SAND, GEORGE.

GEORGE'S CHANNEL. See ST. GEORGE'S CHANNEL.

GEORGES DANDIN, zhôrz dan'dân'. The title of a comedy by Molière (1668).

GEORGETOWN. The capital of British Guiana, situated on the right bank of the river Demerara, 1 mile from its mouth (Map America, S, D 2). It is well built, and its streets are regular and well shaded by trees.

The houses are generally of wood. Some of the streets are traversed by canals. Among the public buildings may be mentioned the Anglican and Roman Catholic cathedrals, the museum, with its library, the Colonial Hospital, orphan asylum, Queen's College, teachers' seminary, seamen's home, etc. There are also botanical gardens, schools, theatres, barracks, electric lights, electric street railways, and telephone service. Georgetown is connected by rail with Mahara and Rosignol. Along the banks of the river extends the Ring, a promenade sheltered with cabbage palms. The city is supplied with water from artesian wells. The harbor provides good anchorage and has a mole and fortifications. The climate is hot but not particularly unhealthy, mean annual temperature, 80° F., mean annual rainfall, 92 inches. The commerce is considerable, the chief exports being sugar, gold, rum, and balata. The population is about 54,000, of whom only about one-tenth are whites.

GEORGETOWN A city of the British Straits Settlements. See **PENANG**.

GEORGETOWN. A railway junction in Halton Co., Ontario, Canada, 29 miles west of Toronto, on the Grand Trunk Railroad (Map Ontario, E 6). Its manufactures include paper, knitting machines, boots and shoes, lumber, gloves, acetylene-gas machines, and carriages. Pop., 1901, 1313, 1911, 1583.

GEORGETOWN A seaport town and the county seat of King's Co., Prince Edward Island, Canada, situated on a peninsula formed by the Cardigan and Brudenell rivers, 39 miles east of Charlottetown by rail (Map New Brunswick) and on the Prince Edward Island Railway. Georgetown has steamboat communication with various ports and carries on a considerable trade in agricultural produce. There is a lobster-packing industry. A United States consular agent is resident here. Pop., 1914 (local est.), 1010.

GEORGETOWN A town and the county seat of Clear Creek Co., Colo., 50 miles west of Denver, on the Colorado and Southern Railroad (Map Colorado, D 2). It has important gold, silver, lead, zinc, and copper mining interests, and is popular as a summer resort because of its picturesque location and healthful climate. The town contains a public library, hospital, and a fine park. The water works are owned by the municipality. Pop., 1900, 1418, 1910, 1950.

GEORGETOWN A town and the county seat of Sussex Co., Del., 40 miles south by east of Dover, on the Pennsylvania Railroad (Map Delaware, J 3). It is in an agricultural region and has canning interests. Pop., 1900, 1658, 1910, 1609.

GEORGETOWN Formerly a town in the District of Columbia, now included within the limits of Washington (q v).

GEORGETOWN A city and the county seat of Scott Co., Ky., 12 miles north of Lexington, on the Queen and Crescent, the Frankfort and Cincinnati, and the Southern railroads (Map Kentucky, F 3). It is primarily a residential place and is the seat of Georgetown College (Baptist), established in 1829. The city is in an agricultural and stock-raising region, and has brickworks, flouring mills, and a large oil-refining plant. The Royal Spring, rising in the centre of the city and flowing 200,000 gallons per hour, supplies the city with water and furnishes power for an ice plant, flour mill, and other industrial establishments. Settled in

1776, Georgetown was first incorporated in 1790 and was chartered as a city of the fourth class in 1894. The government is administered by a mayor, chosen every four years, and a unicameral council, elected on a general ticket. Pop., 1900, 3823, 1910, 4533.

GEORGETOWN A village and the county seat of Brown Co., Ohio, 42 miles east by south of Cincinnati, on the Cincinnati, Georgetown, and Portsmouth, and the Ohio River and Columbus railroads (Map Ohio, C 8). The village contains a children's home. It is the centre and distributing point of a tobacco-growing district and has some manufactures. Limestone is quarried in the vicinity. The electric plant is operated by the town. Pop., 1900, 1529, 1910, 1580.

GEORGETOWN. A city, port of entry, and the county seat of Georgetown Co., S. C., at the head of Winyah Bay, 60 miles by rail northeast of Charleston, on the Georgetown and Western Railroad (Map South Carolina, E 3). It is a seaport of some importance, the market for a fertile agricultural region traversed by 1000 miles of navigable rivers that empty into the bay, has steamship communication with New York, Charleston, and Baltimore, and exports rice, cotton, turpentine, shingles, lumber, fish, grain, alcohol, etc. The manufacturing establishments include machine shops and foundries, bottling works, chemical and canning factories, saw mills, and an alcohol factory. Georgetown, settled about 1700 and incorporated in 1805, is famous as the landing place of Lafayette on his first visit to the United States. It contains a public library and fine custom house and post-office buildings. The government is administered under a charter of 1892, which provides for a mayor chosen biennially and a council elected at large. The water works are owned by the city. Pop., 1900, 4138, 1910, 5530.

GEORGETOWN A city and the county seat of Williamson Co., Tex., 28 miles by rail north of Austin, on the San Gabriel River, and on the International and Great Northern and the Missouri, Kansas, and Texas railroads (Map Texas, D 4). It is in an agricultural and stock-raising region and has cotton gins, a cotton-seed-oil mill, and planing mills. The city is the seat of Southwestern University (Methodist Episcopal, South), founded in 1873. In Page Park are mineral wells, which analysis shows to be similar to the famous Karlsbad Springs. Settled in 1848, Georgetown was incorporated 18 years later and is governed under revised statutes of 1895 by a mayor and council elected biennially on a general ticket. The water works and electric-light plant are owned by the city. Pop., 1900, 2790, 1910, 3096.

GEORGETOWN INDIANS See **SALISHAN STOCK**.

GEORGETOWN UNIVERSITY An institution of higher education, situated at Georgetown, D. C. It was founded in 1789 by members of the Roman Catholic church and was in 1805 transferred to the Society of Jesus in Maryland in whose control it remains. By a congressional Act of 1815 the university was empowered to grant academic degrees, and in 1833 the holy see authorized it to confer degrees, in the name of the church, in philosophy and theology. The university consists of the college; the school of medicine, organized in 1851 and including a school of dentistry, and the school of law, organized in 1870. The college comprises the graduate school, organized in 1856, the under-

graduate department, and the astronomical observatory, established in 1842. The scheme of instruction is, in general, conducted in accordance with the famous *Ratio Studiorum* of the Jesuits. The supervision of students is no closer than in most colleges of equal standing, and the standard of scholarship is very high. Degrees are conferred in arts, philosophy, medicine, dentistry, and law. In 1914 the faculty numbered 177, and the student enrollment was 1567. The income (1914) was about \$260,000. The president in 1914 was Very Rev A J Donlon, S J. Consult J S Easby-Smith, *History of Georgetown University* (2 vols, New York, 1908).

GEORGE WASHINGTON UNIVERSITY

An institution of higher learning, situated at Washington, D C. Founded in 1821 by members of the Baptist church, it was known as Columbian College until 1873, when, following a gift by W W Corcoran with this end in view, the college and professional schools were incorporated as Columbian University. In 1904 this and other educational institutions were merged under the name of George Washington University, thus carrying out the wish of George Washington that a national university be founded at Washington.

The departments and colleges are grouped as follows: (1) Department of Arts and Sciences (a) School of Graduate Studies, (b) Columbian College, (c) College of Engineering and Mechanic Arts, (d) Teachers College, (2) Department of Law, (3) Department of Medicine; (4) Department of Dentistry, (5) Associate Colleges, having independent financial foundations and separate boards of trustees, (a) National College of Pharmacy, (b) College of Veterinary Medicine.

In the academic year 1912-13 the university registered 1347 students. From 1821 to 1913 it granted 7912 degrees on 6390 persons. The president in 1914 was Charles H. Stockton, LL.D.

GEORGIA (Pers. *Gurjistan*, Armen *Vrastan*, Lat *Iberia*, Russ *Grusia*; influenced in popular etymology by the name of the patron saint *George*). A region in Transcaucasia, constituting, until the year 1799, an independent kingdom and now forming the main part of the Russian governments of Tiflis and Kutais. It comprises the ancient Iberia, Colchis, and Albania. The native name of the country is Kathli, or Sakarthvelo.

Tradition traces the origin of the Georgians to Thargamos, a great-grandson of Japhet Mtskhethos, the supposed builder of Mtskhetha, the ancient capital, near Tiflis, is a prominent figure in their legendary history. They are known to have submitted to Alexander the Great and to have been freed from foreign rule and united in one kingdom by Pharnabazus, who ruled from 302 to 237 B.C. Georgia was invaded by Pompey in 65 B.C. and by Trajan in 114 A.D. Georgia was Christianized during the fourth century. A Sassanide dynasty was established in 285 A.D., and continued with a half-century's interregnum until 571, when the long line of Bagratian sovereigns (see BAGRATIDES) came to the throne. The latter drove out the Arab invaders who had subjected the Sassanide princes, reunited the disorganized country, and advanced its civilization and material welfare. In 787, however, the Arabs completely overran the country and imposed their will and religion on

the Georgians. In the eleventh century the country was temporarily brought under the yoke of the Seljuk Turks, but regained its independence under David III (1090-1125). Until the thirteenth century, when it was conquered by the Mongols under Genghis Khan, Georgia prospered greatly and increased in extent under a series of able sovereigns. Under Queen Tamara (1184-1212), who married a Russian prince and thus initiated the intimate connection of Georgia with Russia, the country attained the height of its prosperity and power. Towards the end of the fourteenth century Timur subdued Georgia, but was expelled in the beginning of the next century by George VII. Alexander I, who succeeded George VII, divided the kingdom among his three sons. Each of these states was again divided, and at one time 26 different princes reigned in Georgia. The history of Georgia now falls into two parts: that of the eastern states, Karthli and Kakheti, and that of the western states, including Imeritia, Mingrelia, and Guria. This division was fatal to the independence and power of Georgia. From 1638 to 1650 several of these sovereigns took the oath of allegiance to the Czar of Russia. From the sixteenth to the eighteenth century the eastern states were oppressed by Persia, and in 1799 George XIII resigned in favor of Paul, Emperor of Russia. In 1802 the Emperor Alexander proclaimed the territory a Russian province. Of the three states forming western Georgia, Guria fell into the hands of Russia in 1801 and formally surrendered itself to that Empire by the Treaty of 1810. Mingrelia was virtually added to Russia in 1803. Imeritia had been acquired by Russia towards the close of the eighteenth century (1798). Consult Khakhanoff, *Aperçu géographique et abrégé de l'histoire et de la littérature géorgienne* (Paris, 1900), and Marr, *History of Georgia* (in Russian) (St Petersburg, 1906). See GEORGIAN, or IBERIAN, or GRUSINIAN LANGUAGE, GEORGIANS.

GEORGIA (named in honor of George II of England). A South Atlantic State and one of the original thirteen States of the American Union (Map United States, J 4). It is bounded on the north along the parallel of lat 35° N by Tennessee and North Carolina, on the east by South Carolina and the Atlantic Ocean, on the south by Florida, and on the west by Alabama. Georgia ranks nineteenth in size among the States of the Union, is the largest State east of the Mississippi, the area being 59,265 square miles, of which 540 square miles are water. The extreme length from north to south is 320 miles, and the greatest breadth 253 miles.

Geology. All the large divisions of geological time, except the Jura-Trias, are well represented in Georgia. Metamorphic or crystalline rocks, mostly of Archean age, without distinct stratification but prevalently schistose, including granite, gneiss, etc., characterize the whole of the piedmont region, commonly known as middle Georgia. The rocks of the northeastern mountains, including gneiss, quartzite, mica schist, marble, etc., are also metamorphic, but probably of later age than the piedmont granites. In most of the metamorphic counties are found narrow trap dikes having a general northwest-southeast trend, which may be Triassic, like the lithologically similar Palisades of New Jersey. Near the southern border of the piedmont region is a belt of sandstone of unknown age, forming the Pine Mountains.

The valley and plateau region in the northwestern corner of the State, comprising about 10 counties (northwest Georgia), is made up of Paleozoic rocks, mostly limestone, sandstone, shale, and chert, distinctly stratified but very much folded and faulted in places, ranging from Cambrian to Carboniferous. The last is chiefly confined to the plateaus in the extreme northwest.

The coastal-plain deposits—Cretaceous, Tertiary, and Quaternary—mostly sand, clay, and mail, with not much hard rock, cover about three-fifths of the State, known as south Georgia. The Cretaceous strata underlie the fall-line sand hills which extend nearly across the State, and the gray-marl region southeast of Columbus. The Eocene, Oligocene, Miocene, and Pliocene divisions of the Tertiary form successive belts between the Cretaceous and the coast, their strata dipping gently southeastward. The Pleistocene, or Quaternary, is represented by peat deposits, dunes, river terraces, etc., and perhaps by a thin mantle of sand which covers most of the coastal plain, though the last is now regarded by some geologists as a mere product of weathering of the Cretaceous and Tertiary strata.

Topography and Scenery. In the extreme northwest corner of the State are Sand and Lookout mountains, portions of the Cumberland plateau of Tennessee and Alabama, covering parts of two counties. These mountains, capped with Carboniferous sandstone (coal measures), have comparatively flat tops, several miles wide, averaging about 1000 feet above the adjacent valleys or 2000 feet above sea level. The remainder of the Paleozoic region is mostly narrow chert and sandstone ridges, of lesser elevation than the plateaus just mentioned, and broad shale and limestone valleys, having a general north-northeast to south-southwest trend. There are several caves in the valleys.

The northeastern mountain region terminates on the west in a bold escarpment, 500 to 2000 feet above the neighboring Paleozoic valleys. The whole region is mountainous, with many peaks 2000 to 5000 feet above sea level, and sharp ridges and narrow valleys radiating from them in a very irregular manner, the whole affording some magnificent scenery.

The piedmont region ranges in altitude from about 1500 feet at the foot of the mountains to 300 feet or less along the fall line. Its topography is characterized by broad rounded ridges and comparatively narrow valleys, averaging perhaps 100 feet deep. From most elevated points in the region the horizon appears nearly level, but there are quite a number of isolated peaks standing out conspicuously above the surrounding country, such as Kennesaw Mountain in Cobb County (1809 feet above sea level), Stone Mountain in DeKalb (1686 feet), Little Stone Mountain in the same county, Alcovy Mountain in Walton, and Graves Mountain in Lincoln. By far the most striking of these is Stone Mountain, which is plainly visible and easily reached from Atlanta. It is a massive dome of granite, over a mile in diameter and about 700 feet high, with the north side almost perpendicular. Being mostly bare of vegetation and variegated with vertical stripes made by water running over the smooth rock in rainy weather, it presents a sight never to be forgotten. In the southern part of the piedmont region, between Griffin and Columbus, are the

southernmost mountains in the eastern United States, two sandstone ridges approximately parallel to the fall line. The northern and larger of the two, known as Pine Mountain, extends from near Barnesville to the Chattahoochee River, and its summit is in some places about 1300 feet above sea level, or 800 feet above the country on either side. The Flint River cuts through it near its centre, making some very picturesque scenery. Oak Mountain, a few miles farther south, is smaller in every way.

The boundary between the piedmont region and the coastal plain is known as the fall line because most of the rivers which cross it have shoals or rapids there.

The coastal plain is not in the least mountainous, its maximum elevation along the fall line being about 700 feet, but its topography is considerably diversified. It is traversed by a few inland-facing escarpments, the most pronounced of which are in the western half of the State, at the inland edge of the Eocene red hills and of the rolling wire-grass country, or Altamaha Grit region. Towards the coast and along some of the rivers there are some evidences of low terraces facing seaward.

In the gray-marl region southeast of Columbus there are narrow ridges and broad valleys something like those of northwest Georgia on a small scale. The southern red hill region is characterized by broad ridges and valleys something like those of the piedmont, except that the valleys are usually more or less swampy. The lime-sink region has a gently undulating surface, with many shallow ponds and few streams. Near its south edge in Grady County there is a remarkable bit of scenery in the shape of a lime sink about 50 feet deep, into which a small stream plunges perpendicularly, making a beautiful waterfall. There are a few caves and lakes in the same neighborhood.

The rolling wire-grass country is moderately hilly to nearly level, with many streams, some of the smaller ones being in valleys as much as 50 feet deep. Shallow ponds, which dry up in spring, are common in the more level portions. From the inland edge of this region to the coast the topography gradually flattens, and most of the area within 50 miles of the coast is less than 100 feet above sea level. In the flat country, however, the scenery is somewhat diversified by numerous swamps and ponds and a few low terraces and ridges. From a few miles west of Jesup a broad low ridge, parallel to the coast and 40 miles distant from it, extends southward into the great bend of the St. Mary's River and some distance into Florida. Although it is less than 100 feet high, and its slopes are very gentle, the flatness of the country on both sides of it makes it rather conspicuous. Immediately west of this ridge (as if dammed up by it), near the Florida line, is Okefinokee Swamp, (qv), a little-known but beautiful wilderness about 700 square miles in extent.

Along the south border of the State, between Valdosta and Bainbridge, is a more diversified region, with low hills, comparatively rich soil, and considerable hammock (qv) vegetation. The coast is bordered by a series of islands of various shapes, with sand dunes on their outer edges and extensive salt marshes between them and the mainland.

Waterways. Every part of Georgia, except the lime-sink region and some of the flat coun-

try near the coast, is well supplied with streams. Most of the rivers take fairly direct courses to the Atlantic Ocean and Gulf of Mexico, except in a few of the northernmost counties, where some of the drainage is into the Tennessee River and thus through Alabama, Tennessee, and Kentucky into the Ohio and finally into the Mississippi.

The rivers of the northwestern valley region are mostly sluggish, and the Coosa is navigable from Rome some distance down into Alabama. In the mountain and piedmont regions the rivers are full of rapids, and there is no steamboat navigation, but a vast amount of water power, which is used by many factories and hydroelectric plants. The greatest water powers are just above the fall line at Augusta and Columbus and have contributed largely to the development of those cities. It has been estimated that the total available water power in Georgia, for the lowest stage of the streams, is nearly 500,000 horse power. This makes no allowance for storage reservoirs, which might be expected to double the minimum water power. There is no water power in the coastal plain except on some of the smaller streams in the more elevated portions.

The five large muddy rivers which cross the fall line in Georgia, viz, the Savannah, Oconee, Ocmulgee, Flint, and Chattahoochee, are navigable most of the way across the coastal plain, the first and last all the way (to Augusta and Columbus), and the others usually to Dublin, Hawkinsville, and Albany respectively. The streams which rise below the fall line and are thus confined to the coastal plain are, as a rule, coffee-colored (from vegetable matter) instead of muddy, and are too small for much navigation except in the tidal portions near their mouths.

Between the sea islands above mentioned and the mainland there is an intricate system of crooked tidal channels, forming a continuous protected waterway the whole length of the Georgia coast and some distance into South Carolina and Florida, for sailboats and power boats of light draft. The principal seaports are Savannah, Brunswick, Darien, and St Mary's, in the order named.

Climate Owing to its considerable extent from north to south ($4\frac{1}{2}^{\circ}$ of latitude), combined with the fact that the highest elevations are close to the north border and the lowest at the south, Georgia has a wide range of climate. At Clayton, near the northeast corner, 2100 feet above sea level, the average temperature for January is 40° F, for July 74.4° F, and for the year 56.9° F, with a growing season (period free from killing frosts) of 187 days, or scarcely more than half the year, while the mountain summits in the vicinity, nearly 3000 feet higher, must be considerably colder. In the whole northeastern mountain region the climate is too cold for the successful cultivation of cotton, which seems to require a growing season of at least 200 days. At St Mary's, in the southeast corner of the State, the average temperature for January is 52.4° F, for July 81° F, and for the year 67.4° F, with a growing season of 263 days or nearly nine months. For the whole State the average temperature is just that which mankind finds most comfortable.

The lowest officially recorded temperature in Georgia is 12° below zero F. (though it doubtless falls below this figure on the higher moun-

tains, where no one lives), and the highest 108° F. Snow falls in the mountains several times each winter, and there was 24 inches of it at Rome in December, 1886, and $26\frac{1}{2}$ inches at Diamond, Gilmer Co., in February, 1895. Along the southern border of the State several years sometimes elapse between snows.

The average annual precipitation ranges from about 40 inches at Swainsboro, in the southeastern portion, to 69 inches at Clayton, and doubtless still more at higher altitudes. Outside of the mountains the total precipitation does not seem to be correlated very closely with altitude or distance from the coast or any other known factor. Some of the extreme figures for single years are $101\frac{1}{2}$ inches at Diamond in 1889 and less than 30 inches at Augusta in 1904.

The rainfall is pretty well distributed over the seasons, no station having less than two-fifths or more than two-thirds of the total annual precipitation in the six warmest months (May to October). The driest summers seem to be at Rome, in northwest Georgia, where 42.6 per cent of the rain falls in the six warmest months and 30.2 per cent in the four warmest months, and the wettest (proportionately) along the coast, where nearly two-thirds of the rain comes in the six warmest months and about half in four months.

In general, the amount of summer rain increases towards the coast, except that it is greater in the mountains than at lower altitudes near by.

West Indian hurricanes sweep the coast every few years in late summer or fall, and tornadoes sometimes cut narrow swaths in the interior, mostly in the western half of the State and in spring or early summer, averaging probably not more than one in two or three years for the whole State, or one in 1000 years for any one locality.

Arlington was damaged in that way in 1897, Gainesville in 1903, and Griffin and vicinity in 1908.

Vegetation. Georgia was originally completely covered with forests, except for a few grassy glades and mountain summits ("balds") in the northern half, a few lakes or large ponds in the southern half, salt marshes, beaches, and shifting dunes along the coast, and the channels of rivers. Approximately 67 per cent was still wooded at the time of the last census, but probably not over half of that is virgin forest.

In the northern half the forests are generally composed of short-leaf pines and deciduous trees in approximately equal proportion, except that west of a line drawn from Rome to Macon there is a considerable admixture of long-leaf pine. White pine and hemlock grow in several of the northeastern mountain counties. Long-leaf pine, the most important tree of the South, is found in every county in south Georgia, but is not very abundant in the Cretaceous and Eocene regions. On the Pine Mountains of western middle Georgia, previously mentioned, and still more on the fall-line sand hills and in the lower three-fourths of the coastal plain (except in the southern hammock region and along the coast), it is the dominant feature of the landscape. The forests of this pine are generally very open and sunny, with an undergrowth of wire grass and other low plants.

Swamps of various kinds are chiefly confined

to the coastal plain, and in them are found cypress and various oaks, bays, gums, etc., rarely seen north of the fall line. Many of the swamps, especially coastward, are bordered by hammocks (qv), in which the evergreen magnolia, evergreen willow oak, red bay, dogwood, hop hornbeam, etc., are usually conspicuous. The "Spanish moss" (*Tillandsia usneoides*), an epiphyte which is abundant in the lower and damper parts of the coastal plain, gives a somewhat tropical touch to the landscape.

In the flat pine woods within 50 miles of the coast the saw palmetto (*Serenoa*) is a characteristic feature of the undergrowth, its stiff fanlike leaves rising to an average height of about 2 feet from a prostrate trunk. The cabbage palmetto (*Sabal palmetto*), the only arborescent palm in the eastern United States outside of Florida, grows on several of the sea islands and in a few places on the mainland near by.

Evergreens are most abundant where the soil is poorest and the summers wettest. They probably constitute about 50 per cent of the forest on the higher mountains and 75 per cent in the coast counties.

There are about 140 species of trees in Georgia, including 10 pines, about 25 oaks (at least one of these confined to Georgia), 5 or 6 ashes, 5 gums (including sweet gum, which belongs to a different family from the other four), 4 or 5 maples, 6 or 7 magnolias, 4 elms, and at least 6 hickories. Two or three of the pines are more abundant than any other species, and probably some of the oaks next.

Mineral Resources. Gold was found in White County in 1829, and 10 years later the gold-mining industry had reached such importance that a branch mint was established at Dahlonega. Both quartz and placer mines occur, but most of the output at the present time is made from the former type of deposits, which occur along the southern slopes of the Blue Ridge. Iron ore is mined at several localities in the Paleozoic region, where there are also valuable deposits of ochre, manganese, and bauxite under exploitation. Among nonmetallic products, coal, clay, marble, and granite are most important. The coal fields are located in Dade and Walker counties and are an extension of the Warrior field of Alabama. Brick clays and fire clays are widely distributed throughout the State, but mining is limited practically to localities near the larger towns. The marble industry for several years past has steadily grown in importance, owing to the reputation which Georgia marble has gained all over the United States as a valuable building and ornamental stone. Various qualities of granite suitable for building, street paving, and monumental work are quarried, and the State's resources in this stone are inexhaustible. Among the other mineral products of Georgia are silver, copper, pyrite, graphite, asbestos, talc, mica, corundum, cement, slate, kaolin, ochre, barite, marl, and limestone.

Mining. Georgia is of relatively minor importance in the value of its mineral output, although it ranks second among all the States in the production of five mineral substances—asbestos, barytes, bauxite, mineral paints, and fuller's earth. In relative importance among the States in the production of minerals it ranks thirty-seventh, with an aggregate annual output at a little over \$6,000,000. No metal of any im-

portance is produced except iron, and the only mineral fuel mined is coal, a small amount of which is produced annually in the northwest corner. The branches of the mining industry that furnish the principal portion of the product are the quarries and the clay-working establishments. In the production of stone Georgia ranks first among the Southern States and eleventh among all the States of the Union. It is third among the Southern States and twelfth among all the States in the value of its clay products. Its granites have a high reputation for building, and Georgia marbles are highly praised for their structure and decorative possibilities. The total value of the stone production in 1913 was \$2,105,366, compared with \$1,983,016 in 1912. The principal stone-quarrying counties are Dekalb and Hancock for granite and Pickens for marble. The manufactured clay products in 1913 were valued at \$2,692,619, a decrease from \$2,806,541 in 1912. In addition to the manufactured clay products, 75,815 short tons of raw clay, valued at \$244,953, were sold in 1912. Common brick represents about 60 per cent of the total manufactured clay products, and sewer pipe less than 25 per cent. Bibb County is the principal clay-working county and the chief producer of common and front brick and sewer pipe. Common brick is also extensively manufactured in Richmond and Fulton and other counties. The principal raw-clay product is white clay used in the manufacture of paper, of which in 1912 Georgia produced 48,432 short tons, valued at \$210,908. The State is the principal producer of this grade of clay.

The production of coal, which, as stated above, is limited to the northwest corner of the State in Dade and Walker counties, was, in 1913, 255,626 tons, valued at \$361,319, compared with 227,503 short tons, valued at \$338,426, in 1912. The production of cement decreased from 368,462 barrels, valued at \$330,186, in 1911, to 359,769, valued at \$311,616, in 1912. Georgia is one of the chief sources of supply for ochre, of which 11,869 tons, valued at \$123,616, were produced in 1913. Other productions of considerable importance are bauxite, 19,587 tons, valued at \$80,701; fuller's earth, asbestos, barytes, lime, pyrite, and sand-lime brick. A small amount of gold is mined. In 1912 this amounted to 695 fine ounces, valued at \$14,360. In the same year 135,337 long tons of iron ore, valued at \$227,282, were taken from the iron mines of the State. The total value of the mineral products in 1913 amounted to \$6,525,792, compared with \$6,306,140 in 1912.

Fisheries. The fisheries of the State are not relatively important. The most important product of this industry is the oyster, of which in 1908, the latest year for which statistics are available, 1,423,000 bushels were taken. These were valued at \$332,990. Next in importance was shad, of which 1,333,300 pounds, valued at \$190,000, were taken in 1908. Of some importance are the catches of red snapper, terrapin, turtles, catfish, sea bass, and squeteague, or trout. The total value of the products of the State in 1908 was \$699,660.

Agriculture. Agriculture is the most important industry of the State. There is an abundance of land adapted to the successful growing of crops. The soils are extremely varied, ranging from gray and yellow sandy loams to heavy red sandy loams and red clays. The principal soils of the piedmont region are

a heavy red clay and a gray sandy loam with a heavy red clay subsoil. The soils of the eastern portion of the mountain region are red loams, and clays derived from the weathering of the metamorphic rocks of this section. Within the western mountain and plateau regions the soils are principally sandy and silty loams derived from the weathering of sandstone and shale are not extensively used for agricultural purposes. The soils of the limestone valleys consist either of dark-brown or red clay loam and clay soils, or of cherty-gray silty loams or stony loams. Extensive areas of the mountain section of northern Georgia are covered by forest.

The approximate land area of the State is 37,584,000 acres, and of this there were in farms, in 1910, 26,953,413 acres, compared with 26,392,057 acres in 1900. The improved land in farms in 1910 was 12,298,017 acres, compared with 10,615,644 acres in 1900, or an increase of 15.8 per cent in the decade. The total number of all farms in the State in 1910 was 291,027, compared with 224,691 in 1900, a gain of 63,336 farms, or 29.5 per cent. The average acres per farm in 1910 were 92.6, compared with 117.5 in 1900. The total value of the farm property of the State, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was, in 1910, \$580,546,381, compared with a value in 1900 of \$228,374,637. This is a gain of \$352,171,744, or 154.2 per cent in the decade. The average value of all property per farm increased from \$1016 in 1900 to \$1995 in 1910, and the average value of land per acre increased from \$35.25 in 1900 to \$13.74 in 1910. Since 1870 the increase in improved acreage has been relatively greater than in the total farm acreage, the proportion of improved acreage rising continuously from 28.9 in 1870 to 45.6 in 1910.

The average size of farms in the State has decreased continuously from 440.9 in 1850 to 92.6 acres in 1910. The decline was most rapid in the decade from 1870 to 1880. In 1850 and in 1860 the "plantation" was the common farm unit in a considerable part of the State, as it had been during the entire first half of the century, and it had not entirely disappeared even in 1870. During the last 40 years most plantations have been divided gradually into smaller parcels of land, operated largely by tenants. Of the total number of farms in 1910 (291,027), 98,628 were operated by owners, 1419 by managers, and 190,980 by tenants. Tenants, according to the character of their tenancy, numbered 105,504 share tenants, 3089 share-cash tenants, and 75,223 cash tenants. While the total number of farms increased 109.9 per cent from 1880 to 1910, the number of tenants increased 207.2 per cent. It will be noted, therefore, that by far a larger part of the farms of the State are operated by tenants, but nevertheless the greater farm area is operated by owners. This included 55.1 of all land in farms in 1910, while only 42 per cent of the land area in farms was operated by tenants.

The relative participation of the white and colored population in farming in Georgia is of interest as tending to show in a State in which a large proportion of the population is colored, the development of that race in agricultural pursuits. The total land area owned, managed, or leased by white farmers in 1910 was 19,861,362 acres, and the improved land in

farms was 7,506,455 acres. In 1900 the total acreage was 20,917,083, while the improved acreage was 7,292,998. For colored owners, managers, and tenants, the total acreage in 1910 was 7,092,051. The improved land in farms was 4,791,562. In 1900 the total acreage was 5,474,974, while the improved land was 3,322,646. The total value of farm property owned or leased by white farmers was, in 1910, \$350,320,600, compared with \$144,028,880 in 1900. The value of the land owned or leased by colored farmers in 1910 was \$128,883,732, compared with \$39,341,240 in 1900. It will thus be seen that the total acreage, the improved land in farms, and the value of farm property owned by colored farmers has increased more rapidly than that owned by white farmers. Of all the land in farms operated by white farmers in 1910, 68 per cent was in farms operated by their owners, and 28.2 in tenant farms, while of that in farms operated by colored farmers, 19 per cent was in farms operated by owners and 80.6 per cent in tenant farms. Between 1900 and 1910 the proportion of land in farms operated by owners decreased among white farmers, while among colored farmers it showed an increase. The white farm operators in 1910 numbered 168,468, or 57.9 per cent, while 122,559, or 42.1 per cent, were nonwhites. Of these all but five were negroes. The average size of farms operated by white farmers in 1910 was more than twice as large as that of farms operated by colored farmers. The average size of the former was 117.9 acres and of the latter 57.9 acres. Both classes of farms decreased in size between 1900 and 1910. The proportion of land improved was larger for farms of colored farmers than for those of white farmers, being respectively 67.6 per cent and 37.8 in the total acreage in each class of farms.

Of the 98,628 farms owned in 1910, 78,004 were free from mortgage, while 18,275 were mortgaged. The average debt per farm was \$794, while the average equity per farm was \$1918.

The general character of farming operations in the State is indicated by the table below,

LEADING CROPS		Acreage	Prod bu	Value
Corn	1913	4,066,000	63,023,000	\$57,351,000
	1909	3,383,061	39,374,569	37,079,981
Wheat	1913	140,000	1,708,000	2,050,000
	1909	93,065	752,858	871,494
Oats	1913	420,000	9,240,000	6,283,000
	1909	411,664	6,199,243	4,236,625

	1909	4,883,304	1,992,408	126,695,612

* Tons. † Pounds. ‡ Bales of 500 pounds each.

which shows the acreage, production, and value of the leading crops in 1909 and 1913. The figures for 1909 are from the thirteenth census, and those for 1913 are estimates of the United States Department of Agriculture.

The relative importance of cotton in the agricultural industry of the State is shown by the fact that about two-thirds (66 2 per cent) of the total crops in 1909 was contributed by cotton and somewhat less than one-fifth (18 7 per cent) by cereals. The remainder, representing 15 1 per cent of the total, consisted for the most part of potatoes and other vegetables and of forest products. The leading crops in the order of their importance as judged by value are cotton, corn, cottonseed, sweet potatoes and yams, oats, and hay and forage. The acreage of the combined cereals is about four-fifths that of cotton, while their value is only about one-third that of this latter crop. Corn ranks first among the cereals, representing about seven-eighths both of the total acreage and the total value. There has been a constant increase in the acreage of cotton in recent years. The largest increase was during the decade 1900-10, when it amounted to 1,369,465 acres. The output of cottonseed in 1909 was 996,204 tons, valued at \$23,241,446. During the same decade the production of corn decreased slightly, while oats made a slight increase. The acreage of hay and forage has increased very rapidly during the last two decades. The growing of peanuts has become an important industry, and since 1889 the acreage has increased with great rapidity, more than trebling since that year.

The acreage of cotton is distributed more or less generally throughout the State, except in the mountains and near the coast. The largest acreages, however, are reported for counties located in the lowlands and river bottoms, as Burke, Laurens, Meriwether, and Sumter. The acreage of corn is also distributed very evenly throughout the State. As a rule, those counties which have large acreages of cotton have also large acreages of corn. Counties in which peanuts are chiefly grown are almost entirely in the southern half of the State, the leading county being Brooks. The value of the peanuts grown in 1909 was \$2,440,926. The amount produced was 2,569,787 bushels from 160,317 acres. The growing of sugar cane is important in south Georgia. The cane grown in 1909 was 317,460 tons. From this was made 22,392 pounds of sugar and 5,533,520 gallons of sirup. The total value of sugar-cane products in 1909 was \$2,268,000, compared with \$1,481,000 in 1899.

The total value of orchard fruits grown in 1909 was \$2,930,793. The most important of these were peaches of which there were grown 2,555,499 bushels, valued at \$2,182,613. Other fruits are apples, pears, plums, and prunes. Of grapes there were produced, in 1909, 2,767,366 pounds, valued at \$99,216. Figs are produced in considerable quantities. The production in 1909 was 1,183,494 pounds, valued at \$50,326. The most important small fruit are strawberries, of which 1,157,472 quarts, valued at \$101,161 were grown in 1909.

Live Stock and Dairy Products. The total value of the domestic animals, poultry, and bees in 1910 was \$78,118,098. The cattle numbered 1,080,316, valued at \$14,060,958, horses, 120,067, valued at \$14,193,839, mules, 295,348, valued at \$43,974,611, swine, 1,783,684, valued at \$5,429,016, sheep, 187,644, valued at \$308,212. The number and value of live stock on Jan. 1, 1914, were estimated by the United States Department of Agriculture as follows: cattle other than milch cows, 660,000,

valued at \$8,382,000, milch cows, 402,000, valued at \$12,583,000, sheep, 166,000, valued at \$349,000, swine, 1,945,000, valued at \$15,949,000, horses, 128,000, valued at \$16,768,000, mules, 319,000, valued at \$51,359,000. The total number of fowls of all kinds in 1910 was 5,328,584, valued at \$2,088,563.

The total value of the dairy products, including milk, cream, butter fat, butter, and cheese, made in 1909 was \$6,621,585.

Manufactures. Although Georgia is an agricultural rather than a manufacturing State, it has for the past 60 years been one of the leading and most progressive industrial States of the South. The superior transportation facilities account in part for its rapid industrial growth during this period. It is traversed by the important railway systems of the South, from which numerous feeders afford easy access to all parts of the State. It possesses also the advantages of excellent water communication. The growth of the manufacturing industries of the State is shown by the fact that the total value of the manufactured products, including the products of neighborhood and hand industries, amounted in 1849 to only \$7,082,000, while in 1899, exclusive of the value of the products of the neighborhood and hand industries, it was \$94,532,000, or more than 13 times as great as 50 years previous. The increase during the decade 1900-10 was even more remarkable. The value of products of the factory industries of the State had by 1909 increased to \$202,863,000, a gain of 114 6 per cent in the decade, which was far in excess of the proportionate growth of the population. The table on the following page gives the most important data relating to the manufacturing industries of the State in 1909, in comparison with 1904. Only industries whose product in 1909 was valued at \$1,000,000, or over are shown in this table. There were in Georgia, in 1909, 4792 manufacturing establishments, which gave employment to an average of 118,036 persons during the year and paid out \$43,867,000 in salaries and wages.

Although a few industries predominate in importance, there is a considerable diversity in the manufacturing activities of the State. The most important industry is that connected with the manufacture of textiles. This includes cotton goods, hosiery and knit goods, and woolen and worsted goods. The value of these manufactures in 1909 was \$52,141,000, or 25 7 per cent of the total value of all the manufactured products of the State. The textile industries are confined entirely to the cotton-goods branch, which is first in importance among the individual industries of the State, with a value of products in 1909 almost doubling that of the lumber and timber industry, which ranked next. For a number of years Georgia has produced next to the largest cotton crop of any State, but it ranks only fifth among the States in the value of its cotton manufactures. It is interesting to know that, while the percentage of increase in the value of products from 1899 to 1904 was greater than that in value added by manufacture, from 1904 to 1909 the increase in the value added by manufacture was the greater. This variation was due partly to the rise in price of raw cotton during the earlier five-year period. Closely allied to the cotton industry is the manufacture of hosiery and knit goods, which are made almost entirely of cotton materials. Although the value of products of this

COMPARATIVE SUMMARY FOR 1909 AND 1904

THE STATE—ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

INDUSTRY	Cen- sus	Num- ber of estab- lish- ments	Wage earn- ers (aver- age num- ber)	Capital	Wages	Cost of mater- ials	Value of prod- ucts	Value added by manu- fac- ture

Turpentine and rosin	1909 1904	592 432	12,787 11,736	2,990 2,374	2,931 3,041	1,260 1,156	6,939 7,706	5,679 6,550

industry is small when compared with that of the cotton-goods industry in 1909, it increased 89 per cent from 1899 to 1904 and 39 per cent from 1904 to 1909. The manufacture of woolen, worsted, and felt goods is comparatively unimportant.

The second industry in importance in the value of its products is that connected with lumber and timber and their manufactures. It embraces establishments engaged in logging, and also saw mills, planing mills, and wooden packing-box factories. Statistics of mills engaged exclusively in custom sawing for local consumption are not included. The third important industry is that connected with the manufacture of oil, cottonseed, and cake. This industry, which is dependent upon the cotton crop for its materials, was not important until after 1890, but since that date its growth has been rapid. The fertilizer industry is fourth in importance. In 1904 Georgia contributed about one-sixth the total value of the products of the fertilizer industry. The increased production of fertilizers in the State, the value of which was about five times as great in 1909 as in 1899, is due to several causes, among which were the greater demand for fertilizers, the rapid increase in the manufacture of cottonseed oil in the State, and the increase in the amount of phosphate rock mined in adjoining States.

The presence of extensive pine forests has made the turpentine and rosin industry one of importance. Georgia ranks among the first of the States in the production of these commodities. The industry, however, shows a decrease from 1904 to 1909. This is due in part to a depletion of the forests in certain localities of the State and in part to the unsatisfactory prices for turpentine which tended to discourage its manufacture in 1909.

An examination of the table will show that in 1909 there were 104,588 wage earners employed in the industries of the State. Of these, 83,998 were men and 14,549 were women 16 years of age or over. The wage earners under 16 years of age numbered 6041. The larger part of the total number of women wage earners is employed in the cotton-goods industry, in which nearly one-third of the wage earners are women 16 years of age and over. In the 10-year period 1899-1909 there was a small decrease in the employment of children under 16 years of age.

For the great majority of wage earners employed in the industries of the State, the prevailing hours of labor in 1909 range from 60 to 72 a week. Of all wage earners 23.2 per cent of 1909 were employed in establishments where the prevailing hours were less than 60 a week, and only 1.4 per cent in establishments where there were more than 72 a week.

Unlike some others of the Southern States, the manufacturing industries are not confined chiefly to the larger cities. In 1909 establishments located outside of cities having 10,000 inhabitants or over reported 62.9 per cent of the total value of manufactured products of the State and employed 69.4 per cent of the total average number of wage earners. While very little relative change took place from the 10-year period 1899-1909, on the whole the industries of the districts outside the cities increased somewhat more rapidly in respect to value of products than those located in cities of 10,000 and over. This is due largely to the fact that three of the largest and most important indus-

tries—the manufacture of cotton goods, the lumber, and the fertilizer industries—are to a large extent conducted outside of cities having a population of 10,000 or over.

The increase in the industrial importance of the State is indicated by the rapid growth of its large cities from 1900 to 1910. Atlanta, which in 1900 had a population of 89,872, had increased in 1910 to 154,839. The wage earners in that city in 1909 numbered 12,302, compared with 11,891 in 1904 and 7966 in 1899. The value of the products of the manufactures of Atlanta in 1909 amounted to \$33,038,002, compared with \$25,745,650 in 1904 and \$14,418,834 in 1899. This shows an increase of over 100 per cent in the decade. Macon ranks second in the value of its products, but fourth in the number of wage earners. Augusta ranks second in the number of wage earners and third in the value of products. Both these cities had produced manufactured products of a value of over \$10,000,000 in 1909. Columbus ranked third in the number of wage earners and had products valued at \$8,551,998 in 1909. In Savannah there were 27,725 wage earners and a product valued at \$6,733,651. Other important manufacturing cities are Athens, Rome, Waycross, and Brunswick. In all these, except the last named, the value of products in 1909 exceeded \$1,000,000.

Forest Products. The thirteenth census reports 2083 saw mills in Georgia, with the following output of lumber, laths, and shingles for the year 1909:

Conifers—"Yellow pine" (which means all the pines except white), 1,194,987,000 feet; white pine, 31,324,000, "spruce" (probably meaning spruce pine, for real spruce is not known in Georgia), 2,789,000, hemlock, 966,000, cypress (two species), 27,517,000, cedar, 1,648,000. Total coniferous wood, 1,259,231,000 feet.

Hardwoods—Oak (of several species), 46,329,000 feet; yellow poplar (tulip tree), 21,472,000, red gum (sweet gum), 4,828,000, ash, 3,106,000, chestnut, 2,429,000, cottonwood, 2,260,000, hickory, 1,171,000, maple, 535,000, tupelo gum, 286,000, elm, 274,000, basswood (linden), 88,000, sycamore, 80,000, beech, 67,000, walnut, 48,000, birch, 20,000, cherry, 15,000, all others, 10,000. Total hardwoods, 83,018,000. The reports of the Census Bureau and Forest Service made in combination put the total output of lumber in 1900 at 1,308,610 thousand feet in 1900, 1,041,617 in 1910 and 941,291 thousand feet in 1912.

These figures of course do not include fuel, cross-ties, poles, posts, staves, veneers, tanbark, naval stores (qv), etc. In 1910 the production of turpentine in Georgia was 6,950,000 gallons, worth \$4,509,000, and of rosin 870,000 barrels (of 280 pounds each), worth \$4,637,000. These products come from the long-leaf and one or two other pines. Two or three decades ago Georgia led all the other States in naval stores, but it is now outranked by Florida.

There were 133,260 farms in the State which reported forest products in 1909, and the total value of these products was \$8,938,390, compared with \$3,217,119 in 1899. Of the value in the former year \$5,734,530 was that of products used or to be used on the farms themselves, \$2,502,000 as that of products sold or for sale, and \$702,360 as the amount received for standing timber. These figures show a substantial increase for the decade.

Transportation. See also statement under *Manufactures*. The total mileage of railways on June 30, 1912, was 7066. There were, in addition, 80 miles of double track. The railways having the longest mileage in the State in 1912 were the Central of Georgia Railway, 1331, Southern Railway, 909, Seaboard Air Line, 744, Atlantic Coast Line, 707, Atlanta, Birmingham, and Atlantic Railroad, 484, Georgia and Florida Railway, 310, and the Georgia Railroad, 303. The city of Savannah is one of the most important seaports of the South, and the Savannah, Chattahoochee, Ocmulgee, Altamaha, and Oconee rivers are navigable for considerable distances. The Federal government has for several years been engaged in excavating a channel 26 feet deep in Savannah harbor. The government has also done considerable work in the Savannah River below Augusta. See *Waterways* above.

Education. In common with other Southern States, Georgia has had problems relating to education which have been difficult to solve and which indeed cannot be solved for many years. The negro population constitutes nearly half of the total population of the State, and there is also a large and scattered rural population, the providing of which with satisfactory educational facilities is extremely difficult. It is the disposition of the people and of the Legislature, however, to make as rapid advance in matters concerning education as is possible under the circumstances. The Legislature has passed many local laws concerning education which have in a measure obviated the need of general legislation. If a good idea is advanced and finds favor in a certain community, that community can readily, as a rule, secure legislative consent to its adoption and need not disturb other communities in doing so. There were in the State in 1912 over 80 districts organized under laws of their own choosing, and nearly every modern idea in constructing a separate school system can be found in some one or more of the special laws of the State.

That education is advancing in Georgia is shown by the fact that from 1900 to 1912 the public-school enrollment increased from 484,385 to 571,230, the State appropriation from \$1,440,642 to \$2,550,000, the average length of the school year from 110 days to 142 days, and the number of teachers from 9692 to 13,105. From 1900 to 1910 the white illiterates in the State decreased from 11.9 to 7.8 per cent, and the negro illiterates from 52 to 36.5 per cent. It must be considered, in connection with the negro illiteracy, that, following the close of the Civil War and for many years after, almost all of the colored population was illiterate. The total number of illiterates in the State in 1910 was 389,775. Of these 80,203 were native whites and 308,639 were negroes. The illiterates in 1900 numbered 480,420, of whom 100,431 were native whites and 379,067 were negroes. In the percentage of illiteracy Georgia stands about midway among the Southern States. It ranks above Mississippi, North Carolina, South Carolina, and Alabama. Among all the States Georgia ranks forty-third in the matter of literacy. This low rank is due chiefly to the large negro population, there are more of the colored race in Georgia than in any other State in the Union. There are several counties, however, where the white illiteracy is large. Of the number of pupils

enrolled in the public schools, only six States in 1912 ranked below Georgia, and 44 of the States had more money invested in school property. Indeed only three States—North Carolina, South Carolina, and Mississippi—have spent less for this purpose. Only four States—Mississippi, Alabama, North Carolina, and South Carolina, in the order named—have a smaller annual expenditure for their school children than Georgia. In salaries paid to teachers Georgia ranks low. The average is about \$250 a year, while the average for the United States is about \$485.

The total enrollment in the public schools of the State in 1912 was 571,230. Of these 348,571 were white and 222,659 were colored. The average attendance for white pupils was 226,914 and for colored pupils 130,329. The pupils in the high schools numbered 23,714, of whom 22,797 were white and 917 were colored. The total number of schools in 1912 was 7840, of which 4782 were for white pupils and 3058 for colored. The teachers numbered 13,105, of whom 9053 were teachers in white schools and 4052 in colored schools. The average monthly salary paid to white male teachers in the county systems was \$66, and to white female teachers \$44.44. For colored male teachers in the county systems the average was \$26.80, and for colored female teachers \$20.85. In special systems the average monthly salary paid to white male teachers was \$140, and to white female teachers \$58.92. The average salary for colored male teachers under the special systems was \$31, and for colored female teachers \$30. The total value of school property and equipment in 1912 was \$12,344,595, and the total number of school-houses was 6907. The amount raised by local taxation for the support of schools was \$1,819,860, and the amount given by the State was \$2,550,000.

Georgia is one of the six States having no form of law with regard to compulsory school attendance. While conditions render it inadvisable to attempt radical legislation along this line, the State Commissioner of Education in his report for 1912 suggests that it should be possible to secure legislation that will be helpful through moral as well as legal effect, inflict no hardship upon people, and give ground upon which to stand for further advancement later.

The Legislature of 1911 passed an educational reform bill which in many particulars was an excellent measure. The Act, however, does not apply to Atlanta, to a few county districts, or in most of its details to special incorporated school districts. The title of the chief executive officer of the State was changed from School Commissioner to Superintendent of Schools. There were, in 1913, 11 district agricultural schools. The results attained in these schools have been very successful. There are high schools in nearly all the largest cities. These high schools have to a large extent superseded nearly all the academies, of which there were many in the State previous to the Civil War. In 1913 there were 95 public four-year high schools and 24 private high schools on the accredited list.

Normal schools include the Georgia Normal and Industrial College at Milledgeville, the South Georgia State Normal College at Valdosta, and the State Normal School at Athens. The institutions for higher education include the

University of Georgia (for men) at Athens, the Georgia School of Technology at Atlanta, the North Georgia Agricultural College at Dahlonega, Andrew Female College at Cuthbert, Agnes Scott College for Women at Decatur, Piedmont College at Demorest, Bessie Tift College (for women) at Forsyth, Brenau College (for women) at Gainesville, Lagrange College (for women) at Lagrange, the Southern Female College at Lagrange, Mercer University (for men) at Macon, Wesleyan Female College at Macon, and Shorter College (for women) at Rome. Lamar College was founded at Clarks-ton, near Atlanta, under the auspices of the Christian church, in 1913. Emory College, at Oxford, became in 1914 the collegiate department of a new university established by the Methodist Episcopal Church, South, under the name of Emory University. In addition there were the following colleges for colored students: Atlanta Baptist College at Atlanta, Atlanta University at Atlanta, Morris Brown College at Atlanta, and Clark University at South Atlanta. There is also a State normal and industrial college for colored youths at Savannah.

Banks. On Aug. 9, 1913, there were in the State 116 national banks, with a capital of \$14,268,500, deposits subject to check of \$40,635,215. There were 612 State banks, with a capital of \$20,857,753, deposits subject to check amounting to \$25,886,454, and savings deposits amounting to \$10,462,647. In addition to these there were 28 stock savings banks, with 44,852 depositors, and deposits aggregating \$1,412,064. 6 private banks, with deposits amounting to \$264,230, and 22 loan and trust companies, with deposits subject to check amounting to \$5,904,753 and savings deposits amounting to \$3,213,575.

Finance. The report of the State Treasurer showed a balance at the beginning of the fiscal year 1913 of \$1,113,517. The receipts for the year ending Dec. 31, 1913, amounted to \$6,907,138. The disbursements amounted to \$7,281,030, leaving a balance on Dec. 31, 1913, of \$739,625. The chief disbursements were for the State institutions, State departments, schools, pensions, and interest on the public debt. The bonded debt of the State on Dec. 31, 1913, was \$6,630,702. Of this amount \$3,679,000 in bonds matures in 1915.

Population. The growth of the State has been steady. It has never risen above the ninth nor fallen below the thirteenth place in rank. In 1910 it held tenth place among the States. After Texas, Georgia is the most populous of the Southern States, although the density of population per square mile (44.4) in 1910 is exceeded by some others. The population in 1790 was 82,500. Since 1850, by decades it has been as follows: 1850, 906,000; 1860, 1,057,000; 1870, 1,184,000; 1880, 1,542,000; 1890, 1,837,000; 1900, 2,216,000; 1910, 2,609,121; 1920, 2,895,832. The estimated population of the State on July 1, 1914, was 2,776,513. The per cent of increase of population in the decade 1900-10 was 17.7 compared with 20.6 from 1890 to 1900. As is the case with the other Southern States, the population is preponderantly rural. The urban population, i. e., the population in towns of 2500 or over, was, in 1910, 538,650, while the rural population was 2,070,471. As in other parts of the country, the percentage of urban population, however, shows a greater increase than the rural. From 1900 to 1910 the urban population in-

creased 43.2 per cent, while the rural increased only 12.5 per cent. The white population in 1910 was 1,431,802, while the negroes numbered 1,176,987. In 1900 the white population was 1,181,294, and the colored 1,034,813. In the central part of the State the negroes greatly predominate, and in some counties they outnumber the whites. The white population is almost entirely native-born. Immigration into the State has been very small. The whites of native parentage in 1910 numbered 1,391,058, the whites of foreign or mixed parentage 25,672, and foreign-born whites only 15,072. The population is almost exactly divided between males and females. The males in 1910 numbered 1,305,019 and the females 1,304,102. While among whites males are more numerous than females, this condition is reversed among the negroes. The males of voting age in the State in 1910 numbered 620,616. There were four cities with a population of 25,000 or over. These are Atlanta, Augusta, Macon, and Savannah. The population of these cities in 1910 and 1900 was as follows: Atlanta, 1910, 154,839, 1900, 89,872—Savannah, 1910, 65,064, 1900, 54,244—Augusta, 1910, 41,040, 1900, 39,441—Macon, 1910, 40,665, 1900, 23,272. Both Atlanta and Macon showed large increases in the decade 1900-10. In the case of Atlanta this amounted to 72.3 per cent and in that of Macon to 74.7 per cent. This increase is due partly to the development of manufacturing in these cities. (See *Manufactures*.) Other important cities in the State are Columbus, 1910, 20,554, 1900, 17,614—Athens, 1910, 14,913, 1900, 10,245—Waycross, 1910, 14,485; 1900, 5919—Rome, 1910, 12,099, 1900, 7291—Brunswick, 1910, 10,182, 1900, 9081—Albany, 1910, 8190, 1900, 4606—Americus, 1910, 8063, 1900, 7674—Valdosta, 1910, 7656, 1900, 5613—Griffin, 1910, 7478, 1900, 6857. The capital is Atlanta.

Religion. The Baptist and Methodist denominations predominate, the former having about half the religious membership of the State. The Methodists number (1913) about 300,000, of whom 100,000 are colored. Of the smaller denominations, the Presbyterians have about 20,000 members, the Catholics, 20,000, Christians, about 10,000, and the Congregationalists, about 5000. There are 7000 Hebrews.

Charities and Corrections. The charitable institutions of the State include an insane asylum for whites and another for negroes, both at Milledgeville, an institute for the deaf and dumb at Cave Spring, and an academy for the blind at Macon. In addition to these a number of private benevolent institutions are supported in the larger cities of the State. There is also a home for Confederate soldiers. There is a State penitentiary at Milledgeville. In 1905 a State reformatory, for all persons under 16 years of age convicted of crime in the State, was established. Counties are authorized to maintain industrial farms for those convicted of crime. Georgia, in common with other States, for many years leased its convicts by private contract. The system was first introduced in 1866, when convicts were leased for a term of years to private individuals. In 1907 a law was passed by the Legislature by which the control of State convicts passed from the hands of agents or lessees. A State-prison commission was created which had administrative authority over State institutions. This commission accepted contracts for convict labor, but

the prisoners were cared for by State officials. Great abuses developed in this system, and in 1907-08 an investigation was carried on which showed that many wardens had been in the pay of convict lessees and that the convicts had been subject to cruel treatment in the convict camps. A special session of the Legislature met in that year, and an end was put to the convict lease system in the State. By the terms of the measure passed, the leases of convicts which expired on March 31, 1909, were not to be renewed and after that date the counties were allowed to take their pro rata part of the State convicts for use upon the public works. Any convicts remaining after this distribution may be employed by the prison commission in such a way as in its discretion may seem for the best interests of the State. On April 1, 1909, in accordance with the terms of this Act, 2500 prisoners were transferred from various private stockades to the respective counties in which their crimes were committed. In 1906 a child-labor law was passed by the Legislature. By the terms of this measure no child under 10 years of age is permitted to labor in or about any factory, and after Jan. 1, 1907, no child under 12 may be so employed unless an orphan with no other means of support, or unless a widowed mother or aged father is dependent upon the child's labor. From Jan. 1, 1908, no child under 14 may be employed in a factory between the hours of 7 P. M. and 7 A. M., and from that date no child under 14 may be employed in any factory without a certificate of school attendance of 12 weeks, of which six weeks must be consecutive.

Militia. The militia organizations include three regiments of infantry of 12 companies each and one separate battalion of four companies, one squadron of four troops of cavalry and one separate troop, two batteries of field artillery, four companies of coast artillery, and six detachments of sanitary troops. The total strength of enlisted men in 1913 was 2675, and the officers numbered 223. The official designation is the National Guard of Georgia.

Government. The present constitution of the State was adopted in 1877. It has been amended, but not in essentials. Proposed amendments must receive a two-thirds vote of all members of each House, and a majority vote of the electors qualified to vote for members of the Assembly, each amendment being voted on separately.

Executive.—The executive officers of the State include the Governor, Secretary of State, Comptroller, Treasurer, Attorney-General, Commissioner of Agriculture, and a few others, all elected for two years. The Governor may serve for two consecutive terms and is then ineligible for reelection for four years. The President of the Senate and the Speaker of the House respectively succeed to the governorship in case that office has become vacant. The Governor has the veto power, which may be overcome by a two-thirds vote of each House. He has also the usual powers of granting reprieves, pardons, etc.

Legislative.—The legislative bodies, the Senate and the House of Representatives, compose the General Assembly. The Senate is composed of 44 members and the House of not more than 184. The senatorial districts include contiguous, undivided counties. Representatives are elected from counties on the basis of population, and the counties can neither be joined nor

divided. Elections for members of the Legislature are held biennially in October of the even years. The sessions of the Legislature are annual (in summer) and limited to 50 days. The seat of a member of either House shall be vacated on his removal from the district or county from which he was elected. The House of Representatives has the power of impeachment, and the Senate the right to try impeachments.

Judiciary.—The courts of the State include a supreme court, a court of appeals, superior courts, courts of ordinary, justices of the peace, etc. The supreme court is composed of a chief justice and five associate justices, and a majority of the court constitutes a quorum. These justices are elected by the people and hold office for six years. The court of appeals is composed of three members, also elected by the people and holding office for six years. The superior court includes one judge for each judicial circuit. The term of office is four years, and the judges are elected by the people. The superior courts have exclusive jurisdiction in divorce, in criminal cases where the offender is subject to the death penalty, in cases affecting titles to land, and in equity cases. There is an attorney-general for the State, and solicitors-general for each judicial circuit.

Suffrage and Elections.—The Legislature of 1907 enacted an amended suffrage law which had the effect of practically eliminating the negro vote in the State. This measure required a two-thirds majority of the popular vote to ratify it, and this it received in the autumn of 1908. The measure provided first for educational qualifications. Any male person of lawful age who has paid his poll tax may register and vote if he can read accurately or write accurately from dictation a paragraph of the Constitution of the United States or of the State constitution. As a large percentage of negroes in Georgia are illiterate, this resulted in barring a great number of them from the ballot box. In order, however, that this provision might not disfranchise white as well as colored persons, there was provided, as an alternative to the education qualification, a property qualification by which any person owning or paying taxes on \$500 worth of property may register and vote, whether illiterate or not. As a further safeguard to white voters, provision was made that any person who fought in any of the wars of the United States or of the Confederate States, or a descendant of any such person, may register and vote, such registration to be made before the year 1911, and any person so registering is entitled to vote thereafter without complying with the educational requirements of the suffrage law. Finally, there was a blanket provision which gives the registrars of elections discretion in admitting any applicant for registration who is of good character and understands the duties of citizenship. The Legislature of 1909 passed measures further amending the election laws and providing additional regulations for primary elections and for the registration of voters. Contributions by corporations for election purposes were prohibited. State officers and representatives to Congress are nominated at primary elections. The Legislature of 1913 passed laws providing for the election of United States senators under the provisions of the Seventeenth Amendment.

Other Constitutional and Statutory Provisions.—The legal rate of interest is 7 per cent.

and the rate allowed by contract is 8 per cent. Judgments become outlawed in seven years, notes in six years, and open accounts in four years. The chief causes for divorce are cruel treatment, habitual intoxication, willful desertion for three years, and conviction for offense involving moral turpitude, carrying a sentence of two years or longer. The sale of certain narcotic drugs is prohibited. Pensions are provided for ex-Confederate soldiers and widows. The Legislature of 1911 created a department of fish and game and also a department of commerce and labor. The same Legislature passed a measure creating an insurance department. On Jan. 1, 1908, a State-wide prohibition law went into effect. See *History*, below.

History. Georgia was originally part of the vast domain of the Cherokee and Creek Indians, themselves the successors of a superior race, whose ruined mounds still exist. De Soto, in 1540, penetrated its interior, and Ribault, in 1562, visited its coast. Though the region was included in the grant to the Carolina proprietors, the English did not occupy it, and their claim was denied by the Spanish, who had already worked its mines. In June, 1717, the tract between the Savannah and Altamaha rivers, extending westward to the Pacific Ocean, was granted to Sir Robert Montgomery to be held as a distinct province under the title of the Margravate of Azilia. As it was not settled in the time required, it lapsed to the proprietors, from whom the British government purchased, in 1730, seven-eighths of the territory, which it ceded by the charter of June 8, 1732, to a body of trustees organized for the purpose of "establishing the Colony of Georgia in America." Before this—February, 1732—the remaining one-eighth had been acquired from Lord Carteret. Chief among the trustees was Gen. James Oglethorpe, who desired to found an asylum for the poor debtors of England and for the Protestant refugees of Europe. The government desired to defend the Carolinas against the Spanish and Indians of Florida and to divert from the Spanish and French their trade with the Cherokees. The Colony was the only one of the original thirteen to receive aid from the British government. Oglethorpe landed at Charleston, Jan. 13, 1733, and after negotiations with the Creek Indians took up land on the site of Savannah, February 13. The rules for the Colony required land to be held in tail male and on military service. The introduction of rum and of slaves was forbidden. In 1733, 50 Jewish colonists arrived, and these were followed in 1734 by Lutheran refugees from Germany (Salzburgers). In 1736 a colony of Highlanders arrived, and with them John and Charles Wesley, whose strict religious discipline made them unpopular and shortly led to their return to England. In 1738 George Whitefield founded the orphanage of Bethesda, near Savannah. Though generously aided, the Colony did not flourish. The system of land tenures was oppressive, the scarcity of servants hindered agriculture, and the absence of restrictions in South Carolina drew many settlers there. In 1738 many colonists petitioned for the introduction of slavery. In 1740 Oglethorpe led the troops of Carolina and Georgia in an invasion of Florida, and in 1742, by his strategy, drove off a Spanish fleet that attacked the forts on the Altamaha. Slavery was introduced in 1749, the system of land tenure was changed in

1750, and the first Provincial Assembly met at Savannah in January, 1751. In 1752 the charter was surrendered, and Georgia became a royal province. In 1753 the first General Assembly met at Savannah.

Well governed and generously treated by Parliament, Georgia had little cause to aspire after independence, but St. John's Parish sent a delegate to the second Continental Congress in March, 1775, and its example was followed by the other parishes. In 1778 the British captured Savannah and in 1779 Augusta and Sunbury. An attempt by the Americans and French to retake Savannah was unsuccessful (October, 1779), and it was held by the enemy till 1782. The first State constitution was framed in February, 1777, and on Jan. 2, 1788, the Federal Constitution was ratified. A second State constitution was adopted in 1789, and a third in 1798, when the importation of slaves was forbidden, and the boundaries of the State were defined as extending to the Mississippi on the west and the St. Mary's River on the south. The capital was moved to Louisville in 1795 and to Milledgeville in 1807. The enmity of the Indians had been aroused early in the history of Georgia, from 1783 to 1790 there were troubles with the Creeks and the Cherokees, and from 1790 to 1835 the lust for Indian lands was the chief force that shaped politics. In 1802 the State ceded its territory west of the Chattahoochee to the United States in return for \$1,250,000 and the promise that the Federal government would undertake to extinguish peaceably all Indian titles within the State of Georgia. Large cessions were made by the Creeks to the United States in 1814, after they had been defeated in a sanguinary war, and the territory of the lower Cherokees was acquired in 1817. In 1825 the Creek Indians relinquished to the United States all their lands within the limits of Georgia, and Governor Troup, proceeding on the theory that the inherent title of the Commonwealth in the land had thus been freed from all incumbrance, ordered the survey of the relinquished territory. The Indians, however, repudiated their agreement on the ground of fraud, and this led to a conflict between the Governor and the national administration (1826), in which the State successfully defied the power of the general government. After the same manner the Georgia Legislature in 1827 extended the criminal jurisdiction of the State over a part of the lands held by the Cherokees, thus asserting the incompatibility of an Indian commonwealth existing within the limits of the State with the sovereign power of that State. The Supreme Court, in 1832, declared all such laws void, but its decision was disregarded by the State authorities. The Creeks were expelled in 1832, and in 1835 the Cherokees ceded to the United States all of the disputed territory, removing from the State in 1838.

The Whig party was always strong in Georgia, and when the secession movement broke out there was a powerful Unionist element in the State. The radical party, however, prevailed, and, on Jan. 19, 1861, a convention passed an ordinance of secession by 208 votes against 89. During the war the State bore more than its share of misfortune. (For military operations in Georgia, see *CIVIL WAR*.) Great commercial depression was followed by actual destitution. In 1863 there was want in northern Georgia, and in 1864 the northwestern part

of the State was laid waste, and scores of thousands were living on government bounty. At the end of the war it was estimated that four-fifths of the public wealth had been destroyed. The State was under military rule until June, 1865. On October 30 a convention of delegates at Milledgeville repealed the ordinance of secession, on November 7 the war debt of the State was repudiated, and a new constitution adopted, and on December 5 the Legislature ratified the Thirteenth Amendment. In 1866, however, the Legislature refused to ratify the Fourteenth Amendment, and by the reconstruction acts of March, 1867, Georgia came once more under military rule. A constitutional convention assembled in December, 1867, and in April 25, 1868, a new constitution was adopted by popular vote. The Legislature chosen at the same time complied with the demands of the reconstruction acts and elected United States senators. In July General Meade declared civil government restored, but as the Legislature afterward expelled its colored members on the ground of ineligibility and failed to ratify the Fifteenth Amendment (1869), the State was again excluded from Congress, and again subjected to military rule, under which the expelled negroes were reseated, and the Fourteenth and Fifteenth amendments ratified (February, 1870). Georgia's representatives in Congress were not admitted till January, 1871. During this period trouble was caused by the Ku-Klux Klan (q v).

Business activity recommenced immediately after the war, and, owing to its splendid resources, the State prospered in spite of a long period of misgovernment. Under the wasteful administration of Rufus B. Bullock, Governor from 1868 to 1871, the public debt was increased from \$5,000,000 to \$16,000,000, the larger part of this debt was contracted through the fraudulent indorsement of railroad bonds, which the State later repudiated. Before 1880 charges of embezzlement were frequently brought against public officials, in particular against the State treasurers. Legislation during the period was concerned in great measure with railway affairs, the railroads for the most part being under government control. After 1880 economic development became especially marked as manufactures of cotton, iron, steel, and oil spread over the northern part of the State, and the mining of coal grew to large proportions. The Cotton Exposition of 1881 and the Cotton States and International Exposition of 1898, both held at Atlanta, testified to the prosperity of the State. The division of races continued clean-cut, and though there was no disposition among the better class of whites to hinder the negro in the exercise of his civil rights, political equality was begrudged him, and social equality absolutely denied. In 1891 the Legislature decreed that separate public conveyances be provided for whites and for negroes, and in 1897 the appointment of a negro as postmaster was made impossible by public opinion.

In national politics the State was Democratic throughout the nineteenth century, except in 1840 and 1848, when it cast its electoral vote for the Whig candidate. In State politics Georgia, since 1874, has been uniformly Democratic, the Republicans having scarcely participated in most of the State elections. From 1890 to 1898 the Populist party was powerful in the State, and this influence was continued when in 1904

the People's party nominated Thomas E. Watson, a former Congressman from Georgia, for President. In the first decade of the twentieth century the Democratic party was divided by dissensions caused by differences on State and local questions. Hoke Smith, formerly Secretary of the Interior in President Cleveland's cabinet, was elected Governor in 1906. The Governor takes his seat when the Legislature convenes in the year following the year of his election, and Mr. Smith became Governor on July 1, 1907. On August 6 of that year he signed a prohibition bill which forbade the sale of liquor in the State after Jan. 1, 1908. There was much opposition to the enforcement of this law, especially in Atlanta, where efforts were made to secure injunctions to prevent its enforcement. These, however, failed. Governor Smith was elected on a platform which promised drastic reforms in the operation of railways in the State. The Legislature in 1907 increased the State Railroad Commission to five members instead of three, with the object of securing a majority of members who were not dominated by railroad interests. The Legislature passed severe measures affecting railways, and the attempted enforcement of these led to a conflict between State and Federal authorities. (For a discussion of this, see STATE RIGHTS.) The measure providing for the elimination of the negro vote, which Governor Smith strongly supported, is noted above in the section *Government*. On July 9, 1907, Augustus O. Bacon was unanimously reelected to the United States Senate. Primary elections were held on June 3, 1908, to nominate candidates for Governor. Governor Smith was a candidate for renomination, but was defeated by Joseph M. Brown. The defeat of Governor Smith was generally attributed to his policy in the enforcement of the prohibition law, to the opposition of the business and railroad interests of the State, to his attitude on other State questions, and to the panic of 1907. Mr. Brown had been a member of the State Railroad Commission and had been dismissed by Governor Smith. In the national election held on Nov. 3, 1908, William J. Bryan received 72,350 votes, William H. Taft 41,692, and Thomas E. Watson (Populist) 16,965. In the vote for President the Republicans showed an increase of about 50 per cent in the number of votes cast, compared with those cast in 1904. Governor Brown was inaugurated on June 26, 1909, and on July 6 of that year Alexander S. Clay was unanimously reelected to the United States Senate. In the Democratic primaries for the nomination of Governor held on Aug. 23, 1910, Mr. Smith defeated Governor Brown for the renomination. The issues in this campaign chiefly related to proposed amendments to the law disfranchising negroes. Governor Brown favored the repeal of certain provisions of this law. On the same date primaries were held for Representative to Congress, and a notable result was the defeat of Congressman L. F. Livingston, one of the oldest members of the House in point of service. His defeat was attributed to the fact that he had supported Speaker Cannon in the fight on the rules in the House contrary to the wishes of his party in the State. The State election held on October 5 resulted in a decisive victory for Mr. Smith. At this election three constitutional amendments were adopted. Senator Clay died on Nov. 13, 1910, and Governor Brown appointed Joseph M. Terrell, a former

governor, to fill out the unexpired term Mr Smith was inaugurated Governor on July 1, 1911, and on July 12 he was elected United States Senator to succeed Senator Clay. This brought about a unique situation. Mr Smith was desirous of carrying into effect several important measures as Governor, but on his (Smith's) election to the Senate Mr Terrell resigned. He held that his office ended automatically with the election of Governor Smith, but tendered his resignation in order to remove all doubt. Governor Smith refused to accept the resignation, holding that Mr Terrell was still Senator until he (Governor Smith) qualified, and that he had no intention of so doing until the session of the Legislature came to an end. Senator Terrell refused to serve, and indeed, as he had been stricken with paralysis, was physically unable to return to Washington. During the remainder of this session of Congress, therefore, Georgia had a single representative in the Senate. On the convening of the Sixty-second Congress Governor Smith was sworn in as Senator. The election of Governor Smith to the Senate made it necessary to hold another election for Governor. Joseph M Brown was again a candidate, and in the primaries held on Dec 7, 1911, he was successful. He was inaugurated on Jan 25, 1912. A presidential primary election was held by the Democrats in May, 1912. Underwood received 71,410 votes, and Wilson 57,267. On August 21 of that year John M Slaton was nominated for Governor for the term beginning July 1, 1913. In the same primary Senator Bacon was renominated. At the national election held on Nov 5, 1912, Wilson received 93,171 votes, Roosevelt 22,010, Taft 5190, and Debs 1014. The Democrats elected all the Representatives in Congress. (For an account of the serious railroad strikes occurring in this year, see STRIKES.) Senator Bacon died on Feb 14, 1914, and Governor Slaton appointed W S West to serve until the election of his successor. The State has 12 Representatives in Congress. Prior to 1910 it had 11.

COLONIAL GOVERNORS

GEORGIA, STRAIT or GULF OF. The main section of the arm of the north Pacific Ocean which separates Vancouver Island from the mainland. It lies between Vancouver on the west and British Columbia on the east (Map British Columbia, D 5). It averages perhaps 25 miles in width and 250 miles long and is comparatively deep, having soundings of over 1000 feet. It receives the water of the Fraser River (qv) and some smaller streams and communicates with the open ocean by Queen Charlotte Sound in the north and by the Strait of Juan de Fuca in the south.

GEORGIA, UNIVERSITY OF. An institution of higher education, chartered in 1785 and formally opened at Athens, Ga, in 1801. Its government is vested in a board of trustees appointed by the Governor. At the outbreak of the Civil War the faculty and most of the students joined the Confederate army, and the institution remained closed until 1866. The proceeds of the sales of lands received by Georgia under the United States Land Grant Act of 1862 were transferred to the university in 1872, and the university, which in its inception was designed as a classical school, has, since the close of the Civil War, broadened its scope and

in 1914 comprised Franklin College, the State College of Agriculture, the Graduate School, the Law Department, the Pharmacy Department, the North Georgia Agricultural College, at Dahlonega, the Medical College, at Augusta, the School of Technology, at Atlanta, the Normal and Industrial School for Girls, at Milledgeville, the State Normal School, at Athens, the South Georgia State Normal College, at Valdosta, and the Industrial College for Colored Youths, at Savannah, which includes a well-equipped trade department. The total attendance, including 677 preparatory students, in 1914 was 4864. The library contains about 45,000 volumes, and the university owns 18 buildings. At Athens the running expenses of the university are partly defrayed by an annual State grant of \$52,500. The chancellor in 1914 was D C Barrow, LL D.

GEORGIAN, or IBERIAN, or GRUSINIAN LANGUAGE. The principal language of the Caucasian group of dialects. This family of languages is divided into North and South Caucasian—the former group comprising Abkhasish, Avarish, Kasikumuk or Lak, Arkish, Hurkamsh, Kurinish, Udish, Tchetchentsish, and Thuhish, and the latter division consisting of Georgian itself, Mingrelish, Lazish, and Suanish. The Caucasian languages, which are, broadly speaking, agglutinative in type, although they show inflection in many instances, are comparatively poor in vowels, but they abound in difficult combinations of consonants, especially of gutturals and sibilants. The noun and the verb are highly complicated, and the North Caucasian distinguishes in gender between the six categories of animate and inanimate, rational and irrational, masculine and feminine. The number system in most of the dialects is vigesimal. The Georgian is the only Caucasian dialect that has developed a literature, it begins with a translation of the Bible in the eighth century, though some authorities maintain that there was a version made as early as the fifth century. This literature, within a modified Armenian script, is quite considerable in extent and includes poetry, romance, history, and theology. Among the more important works are the epics *Baramam* and *Rostomam*, and the prose romances *Visramam* and *Darejaniani*—the former by Sarg of Thmogvi and the latter by Mesi of Khoni. The Georgian literature reached its highest development during the seventeenth and eighteenth centuries.

Bibliography. The best general outline of the Caucasian languages, including Georgian, is that of Friedrich Muller in *Grundriss der Sprachwissenschaft*, vol. III, sec. 2 (Vienna, 1887). Consult also: Erckert, *Die Sprachen des kaukasischen Stammes* (Vienna, 1895); Brosset, *Éléments de la grammaire géorgienne* (Paris, 1836); *Dictionnaire géorgien-russe-français* (St Petersburg, 1840); Leist, *Georgische Dichter verdeutscht* (2d ed., Leipzig, 1900); id., *Das georgische Volk* (Dresden, 1903); Bork, *Beiträge zur kaukasischen Sprachwissenschaft* (Königsberg, 1907); Th. Kluge, "Studien zur vergleichenden Sprachwissenschaft der kaukasischen Sprachen," in vol. XII of *Vorderasiatische Gesellschaft Mitteilungen* (Berlin, 1907); Dirr, *Ueber die Klassen (Geschlechter) in den kaukasischen Sprachen* (Leiden, 1908).

GEORGIAN (jôr'jan) **ARCHITECTURE**

The style of architecture in England prevailing during the reigns of the four Georges (but especially of the first three, 1715-1820), and corresponding to the Colonial style in the United States. It was a development from the Italian or Palladian style, introduced by Inigo Jones, in the direction of special adaptation to English requirements, in which it lost much of the distinctive quality of the Italian prototype, but gained, on the other hand, in freedom and picturesqueness of detail and never fell into the extravagances and bad taste of much of the contemporary Italian work. Hawksmoor, James Gibbs (who designed St Martin's-in-the-Fields, London), Colin Campbell, the Adam brothers, Sir William Chambers (architect of Somerset House, London), Robert Taylor, and George Dance, are among the most notable architects of this period. The style was especially successful in domestic architecture and interior decoration and was the natural and logical source of inspiration for American Colonial design. To the churches of Wren (qv) and Gibbs (qv) especially, American architecture owes the models of many churches built between 1750 and 1820. The Georgian style disappeared during the period of artistic death of the early nineteenth century in England, to be followed by the Gothic and Greek revivals. Consult A E Richardson, *Monumental Classic Architecture in Great Britain and Ireland* (London, 1914); F E Wallis, *The Georgian Period* (3 vols., Boston, 1898-1902); G H Polley, *The Architecture and Furniture of the American Colonies during the Eighteenth Century* (2 vols., ib., 1914).

GEORGIAN BAY. An eastern extension of Lake Huron in the Province of Ontario, Canada, about 120 miles long and 50 miles wide, and with depths exceeding 300 feet in the southwest section (Map Ontario, C and D 3). It contains thousands of islands, the largest of which, Grand Manitoulin, partly separates it from Lake Huron. The entrance to the bay is by a channel, 20 miles wide, south of this island.

GEORGIANS. The Georgians, or Kartvelians, form the southern group of peoples of the Caucasus, which includes the following stocks, whose languages appear, though in part only distantly related, to have had a common origin: (1) the Georgians proper, or Grusians, with the Khevsurs, Thushes, Pshavs, and other mountain tribes, the Imers, the Gurians, etc.; (2) the Mingrelians, with the Lazes, Abkhasians, etc.; (3) the Suanitians, or Swans, of Kutais. Physically the Georgian peoples are of the white, not the yellow, race, but rather mixed, the Georgians proper being brachycephalic, the Imers and Mingrelians more or less dolichocephalic, the Imers, too, have a less oval face, but Pantukhoff (1893) considers them to represent best the primitive Georgian race, while Ripley (1899) takes the Mingrelian as typical of this group. The physical beauty of the men and women of the Georgians proper has long been famous, but Chantre (1885) and after him Ripley style it "a perfectly formal, cold, and unintelligent beauty, in no wise expressive of character." Like the Circassians, the Georgians furnished slaves and women for the harems of Turkey, Egypt, etc. The ugliest and most degenerate representatives of the group are to be found among the Suanitians, with whom goitre and cretinism prevail to a considerable extent. The Georgians have resided in their present habitat 4000-5000 years, and the human remains found

in the caves of Kutais suggest a longer period for man's existence in this region. Some authorities, however, think that at the time of their appearance here the primitive Georgians were already somewhat cultured by earlier residence farther south in contact with ancient Aryan or Semitic civilizations in Asia Minor. Later on the Georgians seem to have furnished copper, antimony, etc., to these same civilized centres. Some hold that the primitive inhabitants of the region about Lake Van (the authors of the Vannic inscriptions and the possessors of a certain amount of indigenous culture) and the so-called Mitani were of the Georgian stock. The Georgians proper are the best-known sections of the group. Russian intermixture appears to have stimulated to a certain degree the poetical and general literary genius of this people. Besides the material about the Georgians in Von Erckert's *Der Kaukasus und seine Völker* (Leipzig, 1887), and Chantre's *Recherches anthropologiques dans le Caucase* (4 vols., Lyons, 1885-87), reference may be made to Leist's *Georgische Dichter verdeutscht* (Leipzig, 1887), Wardrop's *The Kingdom of Georgia* (London, 1888), Leist's *Georgien. Natur, Sitten und Bewohner* (Leipzig, 1885), etc.

GEORGIAN SERIES. See CAMBRIAN SYSTEM.

GEORGIAN VERSION. See BIBLE.

GEORGIA SCHOOL OF TECHNOLOGY

An institution for scientific education, founded in 1888 at Atlanta, Ga. It forms a part of the University of Georgia. The special features of the school include a hospital with a medical corps which cares for the physical welfare of the students, a Y M C A building, the centre of student life, in which two secretaries are employed, and an athletic field for the physical development of the students. The school has one of the best equipments for electrical, mechanical, and civil experimental laboratories in the South. Being in the centre of the industrial South, the students have the advantage of inspection in the plants of various manufacturers. The total number of students in all departments of the school in 1914 was 1002, and of these 712 were in the academic department. The instructors numbered 62. The school has no endowment, and the value of the college grounds and buildings in 1914 was about \$750,000. The annual income amounts to about \$140,000. The library contains about 13,000 volumes. The president in 1914 was Kenneth J. Matheson, A.M.

GEORGICS, *gôr'jiks*. A didactic poem by Vergil (q.v.), begun at the suggestion of Mæcenas and dedicated to him. It is an agricultural work in four books, one of the most important of the writings of the Geoponici (q.v.). The first book treats of the cultivation of the fields, the second of trees, the third of horses and cattle, and the fourth of bees. Around these subjects Vergil collected all the experience of the old Italians and associated them with great beauty of style and illustration. The poem is in hexameters and represents the poet's most perfect work in versification. It was composed between 37 and 30 B.C. Consult. Sellar, *Virgil* (2d ed., Oxford, 1883), Glover, *Studies in Virgil* (2d ed., New York, 1912), Royds, *The Beasts, Birds, and Bees of Virgil* (Oxford, 1914).

GEOSYNCLINE, *gê'ô-sîn'klîn*. The name given to a great trough-shaped fold in the

earth's crust, similar to a syncline (q.v.), but of larger amplitude and affecting the strata to profound depths. The name was introduced by J. D. Dana, who inferred the existence of such structural depressions from the extensive development of sedimentary strata in some of the present mountain ranges. The Appalachians, e.g., involve 40,000 feet of Paleozoic rocks, the Rocky Mountains 60,000 feet or more of sediments, and the Alps and Himalayas exhibit equally extensive deposits. Accumulations in continuous series of this kind lead to the inference that they were laid down on a subsiding sea bottom, the underlying platform gradually yielding by flexure to the load. As the area of sedimentation is always close to the shore line, the depression must have the form of a long narrow trough. The period of subsidence may be terminated finally by a crustal movement in the reverse direction which leads to folded mountains, the geosyncline marking a zone of weakness along which the crustal stresses find relief.

GE'OTEU'THIS (Neo-Lat., from Gk γῆ, *gê*, earth + τεῦθις, *teuthis*, cuttlefish). A fossil cuttlefish bone, found in the Upper Liassic beds of England, Germany, and France. Its form is that of a flat, thin wedge. Its chief interest lies in its frequent association with the petrified ink bag of the same animal. This ink bag has been hardened to a glistening black mass, which can be dissolved and used for water-color drawing in much the same manner as is the modern sepia. See CEPHALOPODA, CUTTLEFISH, SEPIA, SQUID.

GEOTROPISM IN ANIMALS. See TROPISM.

GEOTROPISM (jê-ô't'rô-pîz'm) IN PLANTS

(from Gk γῆ, *gê*, earth + τροπή, *trope*, a turning, from τρέπω, *trepein*, to turn). The sensitiveness of plant organs to gravity. The attraction of the earth acts as a stimulus to which the organ responds in a manner comparable to that exhibited in heliotropism, chemotropism, etc. Different organs respond to this stimulus in different ways. Primary roots (i.e., those originating from the embryo itself) are positively geotropic. They normally grow with their tips directed towards the centre of the earth. If placed in any other position, they bend so

FIG 1 POSITIVE GEOTROPISM

Root of pea, *a*, with terminal portion marked into zones 1 millimeter long and laid horizontal, *b*, the same after 24 hours. The third to seventh zones have grown most in length. The curvature is not usually so sharp, but all growing zones bend.

that the axis of the growing portion regains its normal direction. In these organs the receptive (or perceptive) region is in the extreme tip,

while the active or curving region lies 2 or 3 millimeters back of the tip. The attraction of gravity sets up a disturbance (the nature of which is not yet certainly known) in the receptive region, and this is propagated backward

FIG 2 NEGATIVE GEOTROPISM

Radical leaves of onion with basal growth, which have erected themselves from the horizontal, because growth on underside is accelerated by gravity

through the intervening cells to the region of curvature. Here the disturbance causes an alteration in growth such that the side of the root directed upward grows more rapidly than the other side, thus producing a curvature which ultimately directs the tip downward again (Fig 1). Many other plant organs besides primary

FIG 3 NEGATIVE GEOTROPISM

a, a shoot of *Tradescantia*, pinned to cork by lowest internode in a horizontal posture, has erected its tip, because the growth of the base of each internode has been accelerated by the stimulus of the gravity, b, a longitudinal section through the growing region of an internode after induced growth

roots are positively geotropic. Among these are the rhizoids (qv) of many lower plants, stalks of certain fruits and fruit clusters, many aerial roots, etc

The primary shoots of most plants are

apogeotropic (negatively geotropic)—i.e., they normally direct their tips away from the centre of the earth. This kind of sensitiveness is called apogeotropism, or negative geotropism (Fig 2). In such organs the receptive region is not so well marked off from that of bending as in roots. It may extend throughout the whole growing region. Also any region where growth is taking place has the power of curving under this influence. The response is similar to that in roots, but in shoots the region where growth is accelerated is on the underside when placed horizontal. In certain regions where growth has ceased it may be renewed under the influence of geotropic stimulation, and curvature may then ensue. Examples of this are found in the mature joints of grass stems, also in those of the common Wandering Jew (*Tradescantia*). These bend sharply when placed horizontal, in which position they are stimulated by gravity (Fig 3).

Many organs, such as ordinary foliage leaves, lateral branches, lateral roots, rhizomes, runners, etc., usually show another form of response to this stimulus. Their normal position is horizontal, and, if displaced, they return to this position by bending. This tendency is dependent on diageotropism. The stalks of certain flowers, such as those of narcissus and pansy, are diageotropic, so that the flower faces laterally. In dorsiventral organs, e.g., many leaves, diageotropic response may consist of two movements—a curvature which results in bringing the main axis into the horizontal plane, and a torsion of the whole organ which brings its two surfaces into their normal relation to the surface of the earth.

Still another form of geotropic curvature is shown by the growing regions of twiners, like the hop (Fig 4), morning glory, and bean. If the tip of the stem of such a plant be directed upward, gravity will exert an influence upon it which results in the acceleration of growth along one side. This produces a lateral nodding. But as soon as the tip begins to nod, the region of accelerated growth migrates to the flank. The apex is thereby swung to the right or left, describing an irregular circle, clockwise or counterclockwise, according to the plant. What determines these directions

FIG 4 LATERAL GEOTROPISM

Tip of a twiner, the hop vine, showing low coils first formed, and the retarded development of the upper leaves. After Kerner.

is not known. It differs among species of the same family or the same genus, and in some cases even in the plants of the same species. The tendency to respond is termed lateral geotropism, and it is on account of this property that such plants are enabled to twine about a support.

All geotropically sensitive organs may be constrained to grow in a horizontal direction, in spite of the stimulus of gravity, if they are slowly rotated on a horizontal axis by means of a clinostat (qv). In order to produce bending the stimulus must affect the organ in a one-sided manner. When a plant is rotated on the clinostat, all parts are successively directed towards the centre of the earth, for equal periods of time. Hence there is as much tendency to bend in one direction as in another, and the resultant growth is uniformly accelerated on all sides.

Geotropism only in part determines the final position of subterranean plant organs. Hydrotropism, chemotropism, traumatotropism, etc., all have their effect, and the final position is the resultant of all these reactions. The position of aerial organs is determined largely by geotropism and heliotropism (qv). It is difficult to analyze any response and tell to what factor it is due. This can be done best by the use of the clinostat, varying the position of the axis according to the needs of the experiment. See also APOGOTROPISM, DIAGEOTROPISM.

GEPHYREA, jê-fîr'è-a (Neo-Lat nom pl, from Gk γέφυρα, *gephyra*, bridge). A class of Annulata, containing certain marine worms devoid of segmentation in the adult condition, and the larvæ of which are typical trochospheres. The class includes *Sipunculus*, *Echnus*, *Bonellia*, and a few other forms.

GEPIDÆ, jêp'i-dê. A people of Gothic affinities, who in the third century lived on the shores of the Baltic, near the river Vistula. According to legend, they advanced southward with the Goths and established themselves in what is now the western part of Hungary. They were subjugated by Attila (qv), but after his death rose and drove out the Huns. They were defeated by Theodoric the Ostrogoth King in 488 and in 566 or 567 they were conquered by the Lombards. After this the name disappeared, the remnants of the nation being swallowed up by the Avars. Consult Hodgkin, *Italy and her Invaders*, vols 1-v (London, 1885-95).

GEPPERT, gêp'pêrt, KARL EDUARD (1811-81). A German classical scholar. He was born at Stettin and was educated at Breslau, Leipzig, and Berlin, where he was professor from 1846 until his death. His works include *Ueber die Aussprache des Lateinischen im altern Drama* (1858), *Ueber den Ursprung der Homerischen Gesänge* (1840), a polemic directed against Ritschl, *Die altgriechische Bühne* (1843), and editions of plays of Plautus (qv)—the *Capituli* (1859), the *Truculentus* (1863), the *Pœnulus* (1864), the *Epidicus* (1865), and the *Casina* (1866), and editions of other classics. His researches concerning the Roman stage, especially the plays of Plautus, are valuable, and several public performances of the comedies *Trinummus*, *Menæchmi*, and *Rudens* were organized by him.

GERA, gâ'ra (OHG *Geraha*). The capital of the German Principality of Reuss (younger branch), situated on the White Elster about 44 miles east-southeast of Weimar (Map Germany, E 3). It is well laid out, having been almost entirely rebuilt since a fire in 1780. The old houses are very conspicuous, and many of them have cellars cut into the rock. One of the oldest and most prominent buildings is the Rathaus, erected in 1573-76, on the site of the old thirteenth-century building. The churches are of comparatively recent construction. The

palace of the prince, the theatre, and the post office are noteworthy buildings. Gera has a gymnasium, a trade school, and a textile school, also a library with 19,000 volumes. The manufacture of woollens, introduced from Flanders at the end of the sixteenth century, is important, amounting to more than \$14,000,000 annually. Much is exported to the United States. Other manufactures are carpets, carded wool, leather, dyestuffs, castings, gloves, sewing machines, books, lithographed work, harmonicas, machinery, brick, leather, tobacco, jewelry. It has large nurseries. There is also an extensive trade in oil, spirits, and drugs. Pop, 1900, 45,640, 1910, 49,276, principally Protestants. Gera is first mentioned under its present name in the twelfth century, when it belonged to the abbey of Quedlinburg. It passed to the house of Reuss at the beginning of the fourteenth century.

GERACE, jà-ra'châ. A city in the Province of Reggio di Calabria, south Italy, 60 miles northeast of Reggio, beautifully situated near the Ionian Sea, on a slope of the Apennines (Map Italy, F 5). It consists of the lower town, or Marina, and the upper town, 1570 feet above sea level, and 5½ miles away from the Marina. About 2 miles southwest of the Marina are the ruins of the ancient city Locri Epizephyrii (see LOCRI), founded in 683 B.C., famous for its laws, attributed to Zaleucus, and celebrated by Pindar and Demosthenes for its wealth and cultivation of art, the ruins are now concealed by an orange grove. In the cathedral, which was rebuilt after the earthquake of 1783, are some ancient columns. There are iron and coal mines, blast furnaces, and marble quarries, and the soil of the district is rich, producing grain, olives, and grapes, the last of exquisite quality. Near by are a number of warm sulphur springs. Pop (commune), 1901, 10,595, 1911, 11,009.

GERAINT, ge-rānt'. A knight in the Arthurian legends. He appears in the *Mabinogion* romance, *Geraint the son of Erbin*, the source of which is Chrestien de Troyes's *Erec et Enide*, and in Tennyson's idyl *Geraint and Enid*.

GERALD DE BAR'RI. See GIRALDUS DE BARRI.

GERALDINE, jêr'al-dîn, THE FAIR. The lady to whom the Earl of Surrey's sonnets are addressed, now identified with Lady Elizabeth Fitzgerald, daughter of the ninth Earl of Kildare, and, at the time the poems were begun (1537), only nine years old.

GERALDINI, jâ'ral-dê-nê, ALESSANDRO (1455-1525). The first Roman Catholic Bishop of Santo Domingo. He was born at Amelia, Italy, was educated as a soldier, and in 1475-76 served with the Spanish army against Portugal. In Spain he took holy orders, became a friend of Archbishop Mendoza, of Toledo, and by him was introduced to the court of Castile, where he became tutor to the royal princesses. His influence at court is said to have obtained for Columbus his first interview with Ferdinand and Isabella. He was engaged at various times on important diplomatic missions, both for the papacy and for Spain, and held in succession several Italian bishoprics. In 1520 he became the first Bishop of Santo Domingo, where he lived for the remainder of his life and exerted his power and influence to make amends for the ruinous policy that had marked Spanish rule. He wrote a valuable narrative of his voyage to

America, and a description of Santo Domingo, in his *Itinerarium ad Regiones sub Equinoctiali Plaga Constitutas* (1631), and several religious treatises

GERANDO, MARIE JOSEPH DE. See DEGERANDO

GERA'NIA'CEÆ See GERANIUM

GERA'NIUM (Lat., from Gk γέρανιον, *geranon*, crane's-bill, from γέρας, *geranos*, crane). A genus of dicotyledonous plants, the type of the family Geraniaceæ, of which the most important genera are *Geranium*, *Pelargonium*, and *Erodium*. The genus includes nearly 200 species, widely distributed in temperate regions, about

GERANIUM

70 species occurring in North America. A dozen species are indigenous to Great Britain, of which number the stinking crane's-bill, or herb Robert (*Geranium robertianum*), is a common weed. It is a low, spreading herb, with deeply divided leaves and small flowers, and has been used medicinally as an astringent. It is also found in parts of the United States. Alum root (qv), a North American species, with flowers of considerable beauty, is the most valuable medicinally of all the species. It is very astringent and abounds in tannin, a character which belongs to some extent to many species of the genus. The common name, "crane's-bill," is given to many of the species of *Geranium*, on account of the long-beaked fruit, which in splitting aids in scattering the seeds. *Geranium tuberosum*, of southern Europe, and *Geranium dissectum*, the wild carrot of Australia, produce edible tubers. The species of *Geranium* are not extensively cultivated, the plants so widely grown under that name being species of the genus *Pelargonium*, of which there are about 200 species, natives of South Africa and Australia. These plants are prized on account of the colors of the flowers and the shape and marking of the leaves. Many hybrids have been produced, and there is hardly a better-known window plant. They are easily propagated by cuttings, requiring a light, rich soil and good drainage. A number of species produce tuberous edible roots, as *Pelargonium triste*, of the Cape of Good Hope. The leaves of *Pelargonium acetosum* and *Pelargonium peltatum* are acid

and edible. Two species of *Erodium* (*Erodium cicutarium* and *Erodium moschatum*, known as Alfalaria) occur abundantly over a large extent of the Pacific coast region, where they are considered valuable forage plants, since they spring up rapidly after rains and furnish excellent pasturage, and are readily eaten when green by all kinds of stock. When dry, they become very brittle, and are of little value. They seldom attain a height sufficient to admit of being cut for hay. These two species have become naturalized in the eastern United States. A related species (*Erodium cynorium*) is considered one of the most valuable forage plants for the drier portions of Australia.

GÉRARD, zhā'rār', BALTHASAR (1558-84)

A French religious fanatic, born at Villafons, Franche-Comte. Under the name of François Guion he entered the service of William of Orange, and on July 10, 1584, assassinated him as the Prince was leaving his palace at Delft. Gérard was put to death by quartering two weeks later. His family was ennobled by Philip II.

GÉRARD, CÉCILE JULES BASILE (1817-64)

A French traveler, better known as "Gérard the Lion-Killer." His adventures in Algeria were chronicled in *La chasse aux lions* (1855) and *Gérard le tueur des lions* (1858). In 1863 he started on a tour of exploration in West Africa, where he was drowned in 1864.

GÉRARD, CONRAD ALEXANDRE (1729-90)

A French diplomat, brother of Gérard de Rayneval (qv), born at Massevaux, Upper Alsace. He entered the diplomatic service and served as secretary of the French Legation at Mannheim from 1753 to 1759, and Secretary of the French Embassy at Vienna from 1761 to 1766. In July, 1766, he was recalled to Paris to become Secretary of the Council of State and chief clerk in the Bureau of Foreign Affairs. Early in 1778, under instructions from Vergennes, he conducted the negotiations with the American representatives, Franklin, Deane, and Lee, which resulted in the signing of the two treaties with the United States on Feb. 6, 1778, by which France openly sided with the struggling Colonies. In March, 1778, he sailed to America with D'Estaing's fleet, as the first accredited Minister from France to the United States. This post he held until superseded by Luzerne in September, 1779. His activity in America consisted chiefly in subsidizing writers—of whom Thomas Paine was the best known—to create a sentiment favorable to a closer French alliance and in influencing members of Congress who received "gifts" from him. His communications to Congress were mostly oral addresses delivered at secret sessions. He received the degree of LL.D. from Yale, and on his return to France was made Councillor of State.

GÉRARD, ETIENNE MAURICE, COUNT (1773-

1852) A marshal of France, born at Damvillers, in Lorraine. As a volunteer of 1792, he served under Dumouriez and Jourdan and after the Peace of Campo-Formio (1797) went to Vienna with Bernadotte as a colonel and became his chief of staff in 1805. His gallantry at Austerlitz (1805) and Jena (1806) made him brigadier general. On the morning after Wagram (1809) he was made Baron of the Empire. He fought in Spain and in Russia, and practically gained the victory at Bautzen (1813) for Napoleon, who made him Count and general of division. During the campaigns of 1814 he com-

manded at La Rothière and Montereau. After the First Restoration he was named Grand Cross of the Legion of Honor, and Chevalier of St Louis, and received various high appointments. On the return of Napoleon from Elba, Gérard joined him and fought splendidly under Grouchy at Ligny (June 16, 1815). Had his advice been followed, Grouchy would have gone more quickly to the aid of Napoleon on the 18th of June, and Waterloo might have been averted. Napoleon made him a peer of France just after his return. After the Second Restoration Gérard was obliged to leave France and did not return till 1817. He was elected a member of the Chamber of Deputies in 1822-24 and reelected in 1827, took an active part in the revolution of 1830, and commanded the troops appointed to maintain order in Paris. In the same year Louis Philippe appointed Gérard Minister of War, a post which he resigned soon after. In the following year he was made marshal of France and given the command of the expedition to Belgium, in which he distinguished himself by taking Antwerp in December, 1832. In 1835 he succeeded Marshal Mortier as Grand Chancellor of the Legion of Honor. In 1852, the year he died, he became a senator under the Empire.

GÉRARD, FRANÇOIS PASCAL, BARON (1770-1837). A French historical and portrait painter. He was born in Rome, March 4, 1770, and in 1782 came to Paris with his father, an employee of the French Ambassador in Rome. He first studied sculpture under Pajou, but soon took up painting under Brenet and later under David (qv) and became one of his most famous pupils. In 1789 he received the second Roman prize for his picture "Joseph Recognized by his Brothers" (Anger Museum). In 1795 his "Blind Belisarius," now at St Petersburg, attracted much attention. Of his remaining classical subjects the best known are "Psyche Kissed by Cupid" (1798), in the Louvre, the "Three Ages" (1806), now in the Museum of Naples, "Homer" (1814), and "Daphnis and Chloe" (1824), also in the Louvre. He also painted large historical canvases, among which are the "Battle of Austerlitz" (1810) and the "Entrance of Henry IV into Paris" (1817), in the Museum of Versailles. Both of these paintings are well known through engravings. The former was commissioned by Napoleon, who thought highly of Gérard; the latter brought him the title of Baron, and appointment as court painter to Louis XVIII. He had been Chevalier of the Legion of Honor since the foundation of the order and a member of the Institute since 1812. Among his other famous paintings are the "Pestilence at Marseilles" (Marseilles) and the "Coronation of Charles X" (Versailles).

But none of these historical works rise much above the dead level of the Classical school. Gérard is remembered now chiefly for his portraits of the celebrities of his day, with their rich backgrounds, which he reintroduced into art. The earlier show strong characterization and sympathetic handling, but the later ones are theatrical and exaggerated. The best are perhaps those of the painter Isabey and of his daughter (in the Louvre), of Mademoiselle Brogniart (Baron Pichon, Paris), and of Madame Recamier. He also painted portraits of Moreau, Talleyrand, Napoleon (Dresden), and two of Josephine, the Empress Marie Louise, and the King of Rome—300 in all. Many of them are

at Versailles. He died in Paris, Jan 11, 1837. Consult his biography by Lenormant (Paris, 1846), Adam, *Les œuvres du Baron François Gérard* (ib, 1852-57), Henri Gérard, *Correspondance de François Gérard* (ib, 1867), and *Lettres adressées au Baron François Gérard* (ib, 1886), Muther, *History of Modern Painting* (New York, 1907).

GÉRARD, JÉRARD', JAMES WATSON (1867-) An American jurist and diplomat. He was born at Geneseo, N. Y., and graduated from Columbia University in 1900 and from Columbia Law School in 1902. He was chairman of the Democratic campaign committee of New York County for four years, and served as major of the National Guard of the State of New York for four years. From 1908 to 1911 he was associate justice of the Supreme Court of New York. In 1913 he was appointed by President Wilson Ambassador to Germany. In 1914 he was Democratic candidate for United States Senator from New York.

GÉRARD, JEAN IGNACE ISADORE. See GRAND-VILLE.

GÉRARD, JÉRARD', JOHN (1545-1612). An English herbalist and surgeon. He was born at Nantwich, Cheshire, and after spending some time in traveling settled in London. For more than 20 years he acted as superintendent of the gardens of Lord Burghley, Secretary of State to Queen Elizabeth, and had a considerable reputation as barber surgeon, becoming master of the company in 1608. In 1596 he published a catalogue of plants cultivated in his own garden, 1039 in number, inclusive of varieties of the same species. The following year appeared his well-known *Herball*, an adaptation of the *Sturpium Historie Pemptades* of Rembert Dodoens (1583, 2d and 3d eds enlarged and improved, published by Thomas Johnson, 1633 and 1636). Linnæus named the genus *Gerardia* in honor of Gerard.

GÉRARD, ROSEMONDE. See ROSTAND, R. G.
GÉRARD DE NERVAL, zhá'rar' de nàr'val'. The name adopted by Gérard Labrunie (1808-55), a French poet, dramatist, novelist, and miscellaneous writer, born in Paris. He was a conspicuous member of the famous Romantic cénacle of Victor Hugo and Théophile Gautier. His translation of *Faust*, produced in 1828, gained Goethe's approval, and was in part adopted by Berlioz for his symphonic legend, *La damnation de Faust*. His short stories, *Les illuminés* and *Contes et facéties* (1852), suggest a mind verging on insanity, his *Scènes de la vie orientale* (1848-50) rank among the most brilliant pages in French of exotic and vividly imaginative description. His *Le voyage en orient* (1889) has often been reprinted. Gérard's Works were collected in five volumes (1868). He died by suicide. Consult Tourneux (Paris, 1888) and Gauthier-Ferrières, *Gérard de Nerval* (ib, 1906).

GÉRARD DE RAYNEVAL, de rá'n'-vâl', JOSEPH MATHIAS (1746-1812). A French diplomat, brother of Conrad Alexandre Gérard (qv), born at Massevaux, Upper Alsace. He entered the French diplomatic service in 1767 as chargé d'affaires at Ratisbon and was promoted to a similar position at Danzig in 1769. In 1782, while Franklin, Jay, and Adams were negotiating with the French and English representatives at Paris for the conclusion of peace in America, Vergennes secretly dispatched Gé-

rard de Rayneval to London to patch up difficulties between Spain and England. The American commissioners got wind of the mission, and Jay and Adams became convinced that Vergennes was dealing falsely with them, and that he was arranging a secret treaty with England to restrict their western boundary, fishery rights, etc. This belief led them to break off the three-cornered negotiations and, contrary to the instructions of Congress, to conclude a preliminary treaty of peace with the British representatives without further consultation with Vergennes. From 1783 to 1792 Gérard de Rayneval was Minister to England and conducted numerous negotiations during this critical period with great tact and ability. He lived in retirement during the rest of the Revolution and after it engaged in journalism and the study of history and international law, on which he wrote several works of value, such as *Institutions du droit de la nature et des gens* (1803). Consult Masson, *Le département des affaires étrangères pendant la révolution* (Paris, 1877).

GÉRARDMER, zhà-rar'mâr' (Fr., Lake of Gérard, named in honor of Gérard of Alsace, who built a tower on the shore of the lake about 1070). A pretty mountain town, capital of a canton in the Department of Vosges, France, on the Gérardmer Lake, about 33 miles by rail from Epinal (Map· France, N, M 4). It has a large trade in the well-known "gerome" cheese, and has some manufactures of linen. Owing to its picturesque position in the Vosges, it is well patronized as a summer resort and is the usual starting point of excursions into the mountains. Pop., 1901, 9104, 1911, 10,421.

GERARDO DALLE NOTTI, jà-rar'dò dal'là nòt'tà. See HONTHORST, GERARD VAN.

GERARD THE GREAT. See GROOTE

GERARDUS MAGNUS. See GROOTE

GERARDY, zhe-rar'dè', JEAN (1877-).

A Belgian violoncellist, born at Spa. When only seven years of age, he began the study of the violoncello under Richard Bellmann. In 1885 he entered the Conservatory at Verviers, where his progress was so phenomenal that he left the institution in 1888 as a finished virtuoso. He made his début in the same year in London at a concert at which both Paderewski and Ysaye appeared. Although a boy in years, his playing even then was that of a master. With extraordinary success he then concertized in Belgium, Holland, Germany, France, and Russia. In 1899 he visited the United States for the first time, and here he appeared not only as a soloist, but also as an ensemble player with such artists as Ysaye, Kreisler, Hofmann, Marteau, and Godowsky. While on his fifth visit to the States, during the season of 1913-14, the chamber music concerts given by the trio consisting of Gerardy, Ysaye, and Godowsky were among the notable events of the year.

GERASA, jér'a-sa (Lat., from Gk Γέρασα). A city of Palestine in Roman times, situated among the mountains of Gilead, about 20 miles east of the Jordan, a like distance north of Philadelphia, 22 miles from Pella, and 6 miles north of the Jabbok. It is now called Jerash and has been identified by Sir George Grove with Ramoth-gilead. It is well watered by an unfailing stream which empties into the Jabbok. Gerasa is first mentioned as having been captured about 83 B.C. by Alexander Jannæus of the Maccabean line. It was rebuilt by the Romans in 65 B.C. Under Vespasian it was captured by

Lucius Annius, plundered, and burned. It was a member of the Decapolis (qv) and in the time of the Antonines (138-180 A.D.) was one of the most important cities of Syria. In early Christian times it was the seat of a bishopric, but subsequently sank into decay. The ruins are beautiful and extensive. Great portions of the wall are in good preservation, and many columns are still standing on their pedestals. There are remains of buildings and a triumphal arch. Photographs of the ruins were published by the Palestine Exploration Fund in 1867. It is hardly possible to connect Jerash with the "country of the Gerasenes" mentioned in certain accounts as the scene of one of Christ's miracles. See GERASENES, COUNTRY OF THE.

GERASENES, gër'a-senz', COUNTRY OF THE. The scene of the miracle of Jesus in connection with the legion of demons and the herd of swine (Matt viii 28-34, Mark v 1-20, Luke viii 26-39). The name of the people (American Standard Revised text) is variously given as "Gergesenes" in Matthew, and "Gadarenes" in Mark and Luke—the best readings, followed by the Revised Version, seeming to be "Gerasenes" in Mark and Luke and "Gadarenes" in Matthew. "Gergesenes" in Matthew is possibly due to Origen's suggestion that it should be substituted for "Gerasenes," the town Gerasa being too far removed from the scene, while he knew of a town Gergesa on the eastern shore of the lake, to which he thought the name should be conformed. It is of course impossible to refer the miracle to the neighborhood of Gerasa, the modern Jerash (See GERASA). The most probable identification is with the modern Kersa, or Gersa, a ruined village on the east side of the Sea of Galilee, directly opposite Magdala (*El-Mejdel*) and just south of the *Wady Es-Semak*. The topographical conditions of this locality, which are unique for the eastern shore, satisfy in a significant way the requirements of the narrative. This town may have been popularly recognized as included in the larger district of Gadara, which was the principal city of that region. If so, this would account for the reading "Gadarenes" in Mark and Luke.

GERBA. See JERBA

GERBER, gër'bër, ERNST LUDWIG (1746-1819). A German musical lexicographer. He was born at Sondershausen, a son of Heinrich Nikolaus Gerber, court organist in that city. After studying law at Leipzig he devoted himself more exclusively to music, and succeeded to his father's position in 1775. For 10 years he was engaged in collecting material from every part of Europe for his celebrated *Historisch-biographisches Lexikon der Tonkünstler* (1790-92), which work, though out of date, has never been excelled in Germany and still furnishes valuable material to those engaged in musical research. A supplementary edition was subsequently published under the title *Neues Historisch-biographisches Lexikon der Tonkünstler* (4 vols., 1812-14). Gerber's extensive collection of books and musical manuscripts was purchased by the Gesellschaft der Musikfreunde of Vienna and furnished the nucleus of the large library afterwards formed by that society.

GERBER, JOHANN GOTTFRIED HEINRICH (1832-1912). A German engineer. He was born at Hof, Bavaria, and was educated at Nuremberg and Munich. He built the bridge across the Isar at Grosshesselohe, and designed many large bridges in south Germany. The so-

called "cantilever system," the germ of which may be seen in the labors of Pope, Canfield, and others, was patented by him under the name of "Trager mit freischwebenden Stützen," and first practically applied by him at Regnitz. The publications of Gerber include *Die Rheinbrücke bei Mainz* (1863), *Die Isarbrücke bei Grosshesselohe* (1859), *Das Paulsche Tragersystem* (1859), *Trager mit freiliegenden Stützpunkten* (1870).

GERBER, KARL FRIEDRICH WILHELM VON (1823-91). A German jurist and statesman, born at Ebeleben and educated at Leipzig and Heidelberg. He was professor at Jena, Erlangen, Tübingen, and Leipzig, assisted in the codification of the German commercial and marine laws, and in 1871 became the successor of Falkenstein as Minister of Education in Saxony. In 1891 he was appointed President of the Saxon ministry. New laws on education were enacted during his administration, and the relation between the Catholic church and the state was more clearly defined. His *System des deutschen Privatrechts* (1848-49; 17th ed., 1895) is the standard authority on that subject. With Jhering he founded, in 1856, the *Jahrbücher für die Dogmatik des Privatrechts*.

GERBERT, zhār'bār'. See SYLVESTER.

GERBERT, gēr'bērt, MARTIN, BARON VON HORNAU (1720-93). A Roman Catholic prelate and writer on Church music. He was born at Horb on the Neckar and received his education chiefly at the Jesuit School of Freiburg in Breisgau. He joined the Order of the Benedictines in the monastery of Saint-Blaise in 1737, became priest in 1744, was soon thereafter appointed professor of theology, and was chosen abbot in 1764. From 1759 to 1762 he traveled in Germany, Italy, and France, chiefly with a view of obtaining access to the old collections of musical literature contained in the libraries of the monasteries. In 1774 he published at Saint-Blaise *De Cantu et Musica Sacra*, in 1777, *Monumenta Veteris Liturgiae Alemannicae*, four parts, and in 1784, in three volumes, *Scriptores Ecclesiastici de Musica Sacra*, a collection of the principal writers on Church music from the third century till the invention of printing. This work has been of very great importance for the history of music, by preserving writings which otherwise might either have perished or remained unknown. He is also the author of *Codex Epistolaris Rudolphi I* (1772) and *Historia Nigrae Silvae Ordinis Sancti Benedicti* (1783-88). He died at Saint-Blaise, May 3, 1793. Consult his life by Misard (Paris, 1867).

GERBI, jēr'bi, GERBA, jēr'ba. See JERBA.

GERBIL, jēr'bil (from Fr *gerbille*, from Neo-Lat *Gerbillus*, dim of *gerbua*, variant of *jerboa*, from Ar *yār'bū*, flesh of back and loin). Any of several ratlike rodents inhabiting Africa, Asia, and southern Russia. About 50 species are known, forming a subfamily, Gerbillinae, of the rat family (Muridae), characterized by tufted tails and long and powerful hind limbs, giving them much the appearance of jerboas (qv) and enabling them to progress in long leaps with great rapidity. They live underground, in extensive connected burrows. They are fawn-colored, very lively, emit an offensive odor, and are extraordinarily prolific. Well-known species are the Egyptian gerbil (*Gerbillus aegyptiacus*) and the East Indian gerbil (*Gerbillus indicus*), which is strictly nocturnal

and often colonizes in or near cultivated fields, where it does serious damage to grain crops.

GERBOA. See JERBOA.

GERCKE, gēr'ke, ALFRED (1860-) A German classical scholar, born in Hanover and educated at the universities of Bonn and Berlin. He taught in the Berlin Luisengymnasium in 1886-88, was privatdozent at Göttingen in 1890-93, professor at Greifswald in 1895-1909 and rector of the university in 1908, and after 1909 professor at Breslau. He wrote on Seneca, *Seneca-Studien* (1895) and *Studia Annæana* (1900), *Griechische Literaturgeschichte* (1898, 3d ed., 1911-13), *Geschichte der griechisch-romischen Philosophie* (2d ed., 1912), *Methodik* (1910), and, with Norden, *Einführung in die Altertumswissenschaft* (1910-11, 2d ed., 1912 et seq.), *Entstehung der Aeneis* (1913).

GERFALCON, jēr'fa'k'n. See GYRFALCON.

GERGONNE, zhēr'gōn', JOSEPH DIEZ (1771-1859). A French mathematician, born at Nancy, France. In 1792 he was enrolled in the Army of the Moselle and took part in the battle of Valmy. He attended the artillery school at Chalons, was appointed lieutenant, and joined the French army campaigning in the Pyrenees. When his regiment returned to Nîmes, he was appointed professor of mathematics at the *École* of that city. In 1816 he accepted the chair of astronomy at Montpellier and in 1830 the position of rector of the Montpellier Academy. He was one of the founders of modern projective geometry and the first to enunciate the principle of geometric duality. From 1810 to 1831 he published the journal *Annales de Mathématiques* or the *Annales de Gergonne*.

GERGOVIA. The chief city of the Arverni, modern Gergovie, attacked unsuccessfully by Julius Caesar in 52 B.C.

GERHARD, ANDREAS. See HYPERIUS.

GERHARD, gēr'hart, EDUARD (1795-1867). A German classical archaeologist. He was born in Posen, and after studying at Breslau and Berlin took up his residence at Breslau in 1816. The reputation he acquired by his *Lectiones Apollonianae*, published in the same year, led soon afterward to his appointment as professor at the Gymnasium of Posen. On resigning that office in 1819, on account of weakness in the eyes, he traveled in Italy and in 1822 took up his residence in Rome, where, to prosecute his archaeological studies, he remained until 1837. In that year he received an appointment as archaeologist in the Berlin Museum. In 1844 he became professor in the university and member of the Royal Academy. During his long stay in Italy he cooperated in Platner's *Beschreibung der Stadt Rom* and in 1829 was one of the leading spirits in the foundation of the Istituto di Corrispondenza Archeologica, now the Imperial German Archaeological Institute, of which he was vice secretary. Gerhard's great service to archaeological study was in the publication of important groups of monuments and in promoting an orderly classification. Such a worker was much needed at this time, when the excavations at Vulci and elsewhere in Etruria increased so suddenly the mass of early vases and other small objects. For artistic beauty and style Gerhard had little perception, his interest was largely antiquarian, and it is characteristic of him that he was attracted by the Etruscan art, generally of little interest to the artist. His writings are widely scattered in the volumes of the Archaeological Institute,

the Berlin Academy, and various periodicals. Many of these are collected in the *Gesammelte akademische Abhandlungen und kleine Schriften* (Berlin, 1866-68). Among his larger works are *Rapporto intorno i vasi Volcenti* (1831), *Antike Bildwerke* (1827-44), *Auserlesene griechische Vasenbilder* (1839-58), still the best single collection of Greek vases, a publication of selected vases from the Berlin collection, *Griechische und etruskische Trinkschalen* (1843), *Etruskische und campanische Vasenbilder* (1843), *Apulische Vasen* (1846), *Trinkschalen und Gefasse* (1848-50), *Etruskische Spiegel* (4 vols, 1843-68, 5th vol by Klugmann and Korte, 1884-97). With Panofka he prepared a catalogue of the Naples Museum in 1828 and in 1836 one of the antiques in the Berlin Museum. Though Gerhard's *Griechische Mythologie* (1854-55) is still valuable, his mythological work, as well as his interpretation of works of art, suffers from his overestimate of the importance of the mysteries and their symbolism. Consult Jahn, *Eduard Gerhard, ein Lebensabriss* (Berlin, 1868), and Sandys, *A History of Classical Scholarship*, vol. III (Cambridge, 1908).

GERHARD, JOHANN (1582-1637). One of the ablest and most learned German exponents of Lutheran orthodoxy. He was born at Quedlinburg, Oct. 17, 1582. In his fifteenth year he came under the personal influence of Johann Arndt (qv), author of *Das wahre Christentum*, and resolved to study for the Church. Soon after entering the University of Wittenberg (1599) he began to waver in this determination and ultimately interested himself for two years in the study of medicine, but in 1603 resumed his theological studies at Jena, and in the following year received a new impulse from Winkelmann and Mentzer at Marburg. Having graduated and commenced lecturing at Jena in 1605, he in 1606 received and accepted the Duke of Coburg's invitation to the superintendency of Heldburg and mastership of the Gymnasium, soon afterward he became general superintendent of the duchy, in which capacity he was much and usefully engaged in the practical work of ecclesiastical organization until 1616, when he found a more congenial sphere in the senior theological chair at Jena, where the remainder of his life was spent and where he died, Aug. 17, 1637. He was a prolific writer. His most famous works are *Loco Communes Theologicae* (1610-22) and his *Sacred Meditations* (1606), which have been translated into several languages (English, by Winterton, 1631, many editions). His life was written in Latin by Fischer (Leipzig, 1723) and in German by Boettcher (Dresden, 1858).

GERHARD, WILLIAM PAUL (1854-). An American sanitary engineer, born in Hamburg, Germany. After graduating from the Polytechnic School, Karlsruhe, Baden, he spent one year as a civil engineer in his native city, was for several years in St. Louis, Mo., assisted Col. George E. Waring (1881-83), edited *Building* (1885-86), and was sanitary engineer on the staff of the State architect of New York (1892-99). His publications include *House Drainage and Sanitary Plumbing* (1881, 10th ed., 1902), *The Disposal of Household Wastes* (1890), *Theatres (safety, etc.)* (1900), *The Sanitation of Public Buildings* (1907), *Modern Baths and Bath Houses* (1908), *Guide to Sanitary Inspections* (4th ed., 1909), *Sanitation and Sanitary Engineering* (1909),

Flies and Mosquitoes as Carriers of Disease (1911).

GERHARDT, GÉR'HART, DAGOBERT VON (pen name, Gerhard von Amyntor) (1831-1910). A German soldier, poet, and novelist, born at Liegnitz. After attending the university he entered the Prussian army and advanced to the rank of major. He was severely wounded in the assault upon the fortifications of Düppel during the Danish War of 1864 and in 1867 was employed by Moltke on the general staff at Berlin. He served in the Franco-German War (1870-71). He has become known in literature rather late in life and then chiefly through his numerous novels, such as *Das best Du!* (1882), *Ein Problem* (1884), *Vom Buchstaben zum Geiste* (1886), *Gerke Suteinanne* (3d ed., 1890), *Durch Nacht zum Licht* (1887), *Die Cäs Moll Sonate* (1891), *Ein Kampf um Gott* (1902), and the sketch, *Eine moderne Abendgesellschaft*, treating of the Jewish question (3d ed., 1881).

GERHARDT, EDUARD (1813-88). A German architectural painter, born at Erfurt. He was at first a lithographer, then studied architecture in Cologne, and under Semper in Dresden, but in 1837 took up painting at Munich. He continued his studies (1848) in Italy, Spain, and Portugal. Summoned afterward to Lisbon to instruct the princes of the royal family, he returned in 1851 and settled in Munich. He excelled in depicting Moorish architecture, his oil paintings and water colors being of equal merit, as may be judged by "The Palace of the Inquisition at Cordova" (1863), "Lion Court in the Alhambra" (1861), "Interior of St Mark's, Venice" (1864), all in the New Pinakothek, and by "The Alhambra by Moonlight," "The Generalife," "The Comares Tower," and two views of Venice, all in the Schack Gallery, Munich.

GERHARDT, ELENA (1883-). A distinguished German lieder singer, born in Leipzig, Nov. 11, 1883. Although she had been a precocious child and sung at many school entertainments, her voice was not systematically trained until she entered the Leipzig Conservatory in 1899, where she studied under Marie Hedmont till 1903. In that year she leaped into fame at one bound, when she made her debut in Leipzig in a recital with Arthur Nikisch at the piano. Because of her extraordinary success she was practically forced, against her own inclination, into opera. She appeared as Mignon and Charlotte (Werther) at the Leipzig Opera, eight times in each rôle, and then decided to abandon the stage to devote herself entirely to concert work. Before long she was acknowledged as one of the world's greatest lieder singers, all Europe paid homage to her art. In 1912 she made her first tour of the United States, appearing with signal success in numerous recitals and with the principal orchestras. The demand for her services was such that in the following season she had to make a second American tour.

GERHARDT, KARL FRIEDRICH (1816-56). An eminent French chemist, born at Strassburg. At the age of 15 he was sent to the Polytechnic School at Karlsruhe, where his attendance at Walchner's lectures first awakened in his mind a taste for chemistry. After two years he removed to Leipzig, where he attended the lectures of Erdmann, which seem to have developed in him a passion for questions of speculative chemistry. On his return home he reluctantly

entered upon the business of his father, who was a manufacturer of chemical products, but in his twentieth year he enlisted in a regiment of chasseurs. He soon, however, found military life as insupportable as a commercial career. He therefore purchased his discharge and set out for the laboratory of Giessen, where he worked under Liebig's direction for 18 months. In 1838 he arrived in Paris and there was cordially welcomed by Dumas. In the laboratory of the Jardin des Plantes he soon commenced, jointly with Cahours, his important researches on the essential oils. In 1844 he was appointed professor of general chemistry in the faculty of sciences at Montpellier. About this time he published his *Précis de chimie organique*. In 1848 he resigned his chair and returned to Paris, in order to follow out uninterruptedly his special investigations, and in that city he established, between the years 1849 and 1855, in successive memoirs, his views of series and his theory of types. It was there, also, that he gave to the scientific world his researches upon the anhydrous acids and the oxides. In 1855 he was made professor of chemistry at Strassburg and corresponding member of the Academy of Sciences of Paris. All his ideas and his discoveries are embodied in his *Traité de chimie organique* (4 vols., 1853-56). He had hardly completed the correction of the last proof of this great work when, after an illness of only two days, he died. Consult Grimaux, *Charles Gerhardt sa vie, son œuvre, sa correspondance* (Paris, 1900), and Ostwald, *Grosse Manner*, vol. 1 (Leipzig, 1909). See CHEMISTRY, AVOGADRO'S RULE.

GERHARDT, PAULUS, or **PAUL** (1607-76). After Luther, the greatest of German hymn writers. He was born in Saxony, studied at Wittenberg, and became pastor at Mittenwalde. In 1657 he removed to Berlin, but retired in 1666, rather than enter the union with the Reformed church, and in 1669 removed to Lubben, where he died in 1676. He was an active supporter of the Lutherans in their controversies with the Reformed churches. Among his most familiar hymns are "O sacred head once wounded" (Eng trans by J. W. Alexander), "Commit thou all thy griefs," and "Jesus, Thy boundless love to me" (English trans by John Wesley). Consult the critical editions of his hymns by Bachmann (Berlin, 1866) and Goecke (Leipzig, 1877), his life by Langbecker (Berlin, 1841), Kelly, *Gerhardt's Spiritual Songs* (London, 1867). The first collection of his hymns appeared in 1667.

GERHARDUS MAGNUS. See GROOTE.

GERHART, EMANUEL VOGEL (1817-1904). An American minister of the German Reformed church. He was born at Freeburg, Pa., and was educated at Marshall College and at the Mercersburg Theological Seminary. After acting as president of Heidelberg College, in 1851 he became professor of theology in the Theological Seminary at Tiffin, Ohio, whence he was called to the presidency of Franklin and Marshall College in 1855, where he also lectured on mental and moral philosophy. In 1868 he was appointed professor of philosophy at the Reformed Church Seminary, Lancaster, Pa. He edited Rauch's *Inner Life* and, for several years, the *Mercersburg Review*, and wrote *Philosophy and Logic* (1858) and *Institutions of the Christian Religion* (1891).

GERHOH, gër'hō, or **GERHOCH VON REICH-**

ERSBERG, gër'hók fön rīk'ërs-bërk (1093-1169). A German theologian, born at Polling, near Weilheim, Bavaria. In 1132 he was appointed by Archbishop Conrad to the chief jurisdiction of the canonry of Reichersberg, and he became conspicuous as a reformer of the institution. His *De Investigatione Antichristi* severely criticizes the ecclesiastical conditions of his time and is historically valuable in its bearing upon the Second Crusade. His unfinished "Commentary on the Psalms" and most of his works are published in Migne's *Patrologia latina*, vols. cxviii and cxvix (Paris, 1844-80), and the most important by Sackur in *Monumenta Germaniae Historica* (Hanover, 1897). Consult the biography by Nobbe (Leipzig, 1881).

GERI (gä'rè) **AND FREKI**, frä'kè. The wolves of Odin (qv). They lie at his feet as he is seated on his throne in Valhalla, ready to feast with his chosen heroes. Odin himself needs no food, so he gives all the meat that is set before him to his wolves.

GÉRICAULT, zhä'rè'kō', **JEAN-LOUIS ANDRÉ THÉODORE** (1791-1824). A French painter, the first leader of the Romantic school in its revolt against the tyranny of classicism of David.

Géricault was born at Rouen, Sept. 26, 1791. The family moved to Paris soon afterward, and the boy entered the Lycée Louis-le-Grand. He left this school in 1808. He first entered the atelier of Carle Vernet (qv), and in 1810 he went over to the atelier of Guérin, but there was never any artistic sympathy between master and pupil. Much of his time was spent in Versailles, where he found the stables of the palace open to him, and where he gained his knowledge of the anatomy and action of horses.

At the Salon of 1812 Géricault exhibited one of the best known of his pictures, "A Cavalry Officer on Horseback" (now in the Louvre), which created an immediate sensation. His "Wounded Cuirassier" was exhibited in the Salon of 1814, but was not especially successful. Géricault in a fit of disappointment entered the army and served for a time in the garrison of Versailles. In 1817 he went to Italy and, after a month in Florence, settled for two years in Rome. The work of the Italian masters affected him powerfully, that of Michelangelo appealing especially to his temperament. The productions of this period are perhaps the most vigorous of his entire career. They are mainly in the form of drawings, of which many have been preserved. The finest of these are a series of studies for a picture which he intended to paint of the horse race in the Corso during Carnival. The painting called the "Raft of Medusa" (now in the Louvre) has come to be deemed one of the most powerful productions of the French school. At the exhibition of 1819, however, it was placed too high and was received very coldly. Géricault carried the picture to England, where he exhibited it at a shilling admission, realizing 20,000 francs. During his stay in England Géricault associated much with Charlet, the lithographer and caricaturist, and while in England he painted his "Race for the Derby at Epsom" (Louvre), his last great painting. There are many of his powerful sketches and studies in the Louvre, the Rouen Museum, and other collections throughout Europe, and a number of his lithographs are preserved in the Cabinet des Estampes, Paris. He also modeled bronzes and wax sketches, the finest of those surviving being

an anatomical study of a horse Géricault's temperament was too vivid and sympathetic to tolerate the formal and conventional The realities of his time appealed to him too intensely to permit his mind to rest upon the unrealities of the Classical school

Soon after his return to Paris in 1822 Géricault was injured by a fall from a horse and spent the rest of his life in extreme distress He died in Paris, Jan 18, 1824 Consult Blanc, *Histoire des peintres de l'école française* (Paris, 1865), Clément, *Géricault Etude biographique et critique* (ib, 1868), Brownell, *French Art, Classic and Contemporary* (New York, 1901), Muther, *History of Modern Painting* (London, 1907).

GERICKE, gä'rik-ə, WILHELM (1845-1925)

A German orchestral conductor He was born at Gratz, Austria, and early gave evidence of a strong musical temperament In 1862 he entered the Vienna Conservatory, where he studied under Dessoff Leaving the conservatory in 1865, he became kapellmeister of the theatre at Linz and in 1874 received the appointment of second kapellmeister of the Vienna Court Opera, of which Hans Richter (qv) was first kapellmeister On the retirement of Brahms from the conductorship of the Gesellschaftsconcerte in 1880, Gericke succeeded him and became also the conductor of the Singverein His fame as a conductor, and particularly as a drillmaster, induced the Boston (Mass) Symphony Orchestra to secure him as its leader From 1884 to 1889 he held the baton of the organization and succeeded in placing it in the front rank of the world's great orchestras In 1889 he returned to Vienna and to the leadership of the Gesellschaftsconcerte (Nikisch succeeding him in Boston), but resigned again in 1895 Three years later he once more took charge of the Boston Orchestra and retired in 1906 He has published many works for the orchestra, besides much pianoforte and chamber music

GERIG, JOHN LAWRENCE (1878-). An American university professor, born at Columbia, Mo, where he graduated from the University of Missouri in 1898 He studied also at the University of Nebraska (PhD, 1902) and in Paris (1903-05), taught in the summer sessions of the universities of Missouri (1889) and Nebraska (1901), and was instructor at the latter institution in 1901-03 and at Williams College in 1905-06 At Columbia University he was lecturer, tutor, instructor, and assistant professor of Romance languages and Celtic between 1906 and 1911, when he became associate professor of the same subjects He was assistant editor of Edgren's *Italian Dictionary* (1902) and became associate editor of the *Romanic Review* and contributor to the *New International Yearbook* and to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

GERING, gä'ring, ULRICH (c1440-1510) A Swiss printer He was one of the printers called by Guillaume Fichet, then rector of the Sorbonne, to put up the first printing press ever used in France In this he was assisted by Michel Friburger and Martin Crantz

GERIN-LAJOIE, gër'an-lä'zhwa', ANTOINE (1824-82) A Canadian novelist and poet He was born in Yamachiche, Province of Quebec, and was educated at Nicolet Seminary While studying law, he became connected with *La Minerve* (Montreal), of which journal he was early chief editor (until 1847) In 1848 he was

admitted to the bar He was one of the founders, and for several years president, of L'Institut Canadien In 1852 he became one of the French translators in the Canada Legislative Assembly and subsequently assistant parliamentary librarian He was a contributor, both in prose and verse, to several periodicals, principally to *Les Sources Canadiennes*, of which he was one of the directors, and *Le Foyer Canadien*, of which he was one of the founders and also one of the editors He died at Ottawa His publications include *Le jeune Latour, tragédie en trois actes* (1844), *Catechisme politique* (1851), *Jean Rivard, le défricheur canadien* (1862-64), *Dix ans d'histoire du Canada, 1840-50* (1888), a luminous study of the period in which responsible government was established See CANADIAN LITERATURE

GERIZIM, gër'i-zim. See EBAL AND GERIZIM
GERLACH, gër'lag, ERNST LUDWIG VON (1795-1877) A Prussian statesman, born in Berlin He became one of the leaders of the Prussian High-Church party, and was president of the Magdeburg Superior Court from 1844 to 1874 In 1849 he was one of the founders of the *Neue Preussische Zeitung* (the *Kreuzzeitung*), in which he freely expressed his ultra-conservative views Elected to the Prussian Upper House in 1849, he was until 1858 a leader of the extreme Right He published a pamphlet, *Die Annexionen und der norddeutsche Bund* (1866), denouncing the annexations of 1866 and the exclusion of Austria from the German Bund He was killed by a carriage Consult the biographical material (Schwerin, 1903) edited by Jakob von Gerlach

GERLACH, FRANZ DOROTHEUS (1793-1876) A Swiss historian and classical scholar, born at Wolfsberringen, near Gotha, and educated at Gottingen He was professor at the University of Basel from 1820 until shortly before his death and during the greater part of that time occupied also the position of chief librarian at that institution He was distinguished chiefly for his pedagogical ability His works include a German translation of Livy (1856-73), with an introductory volume entitled *Die Geschichtsschreiber der Römer von den frühesten Zeiten bis auf Orosius* (1855), and editions of Tacitus' *Germania* (1835), Sallust (1823-31), Lucilius (1846), and Nonius Marcellus (1842)

GERLACH, OTTO VON (1801-49) A German theologian He was born in Berlin, studied law at Heidelberg and Gottingen and theology at Berlin, preached for a time in the latter city, and became court chaplain in 1847 With his brothers, Ernst Ludwig von Gerlach (qv) and Leopold von Gerlach, he was an upholder of orthodoxy in Prussia He wrote a commentary on the Bible (1841, often reprinted, and published in a Swedish version) and was commissioned by Frederick William IV to study English Church organization

GERLACHE, zhâr'lash', ADRIEN DE (DE GOMMERY) (1866-) A Belgian naval officer, scientist, and explorer His field work began in 1895 as a member of the expedition to Jan Mayen and southeast Greenland He was the leading spirit in the organization of the Belgian Antarctic expedition, which he commanded in 1898-99, in the *Belgica* It was the first expedition to pass a winter within the Antarctic circle, and among its discoveries were Danco Land, Gerlache Strait, and other parts of Palmer Land, continent of Antarctica. Beset by

the pack, the *Belgica* drifted for 11 months across areas largely unvisited, its explorations covering the Antarctic Ocean between 70° to 72° lat S, 85° to 103° long W. In 1901 he led a zoological expedition to the Persian Gulf. In 1907 he accompanied the Duke of Orleans in his explorations of the sea off the coast of north-east Greenland. Gerlache's principal publication is *Quinze mois dans l'Antarctique* (Paris, 1902). He was vice president of the Belgica Commission and later was appointed curator in the Royal Museum of Natural History, Brussels.

GERLACHE, ETIENNE CONSTANTIN, BARON DE (1785-1871). A Belgian statesman and historian, born in Luxembourg. He studied and practiced law in Paris. In 1824 he was elected deputy from Liège to the Second Chamber of the States-General. At the time of the revolution of 1830, as president of the committee appointed to revise the constitution, he advocated complete political and religious liberty and opposed the Duc de Nemours on the ground that the latter's election implied a sort of annexation to France. He was head of the deputation sent to offer the crown to Prince Leopold of Saxe-Coburg. In 1831, as President of the Chamber of Representatives, he received the oath exacted from the King by the constitution, and the following year was appointed first president of the Court of Cassation, which position he held until 1867. In 1843 he received the title of Baron. He was one of the Catholic leaders, and after early radicalism became more and more conservative. Gerlache was also widely known as a writer. His *Histoire du royaume des Pays-Bas depuis 1814 jusqu'en 1830* (1839) attacks the Dutch government and praises Catholic orthodoxy. Besides some works on contemporaneous history, he published *Salluste et quelques-uns des principaux historiens de l'antiquité* (1859). His collected works were published in six volumes (Brussels, 1874-75) by Thomissen, with a biographical sketch. Consult the biography by Juste (ib, 1870).

GERLAND, GERHART, GEORG KARL CORNELIUS (1833-) A German geographer and ethnologist, born at Cassel and educated at Marburg and Berlin. In 1875 he was appointed professor of geography and ethnology at Strassburg and in 1900 became director of the earthquake observatory in that city. His works include *Ueber das Aussterben der Naturvölker* (1868), *Atlas der Ethnographie* (1876), "Die Zukunft der Indianer" (in the *Globus*, 1879), "Atlas der Völkerkunde," in Berghaus, *Physikalischer Atlas* (7th part, 1891-92), *I Kant, seine geographische und anthropologische Arbeiten* (1905), *Mythus von der Sintflut* (1912).

GERM See BACTERIA, DISEASE, GERM THEORY OF.

GERMAIN, JÉR-MÂN', GEORGE SACKVILLE, VISCOUNT SACKVILLE (1716-85). An English soldier and politician. He went to Westminster School and in 1731 accompanied his father, the Duke of Dorset, to Dublin on his appointment as Lord Lieutenant of Ireland. Sackville, as he was called up to 1770, was educated at Trinity College, Dublin, and in 1737 was commissioned a captain in the Sixth Dragoon Guards. Promoted lieutenant colonel of the Twenty-eighth Foot (1740), he served with his regiment under Cumberland in Flanders, being wounded at Fontenoy in May, 1745. He was made a colonel in 1746. During his father's second term as Lord Lieutenant of Ireland (1751-56) Sackville was

his principal secretary and Secretary of War for Ireland, and sat in the English and Irish Commons. In 1758 he took part in the expedition to Saint-Malo (France) and in the same year accompanied the third Duke of Marlborough as second in command of the English troops sent to Hanover to aid Prince Ferdinand of Brunswick in his operations against the French. Sackville succeeded to the British command after the death of Marlborough, but for his refusal to obey Ferdinand's orders at the victorious battle of Minden (August, 1759) he was dismissed from the army and replaced by his rival Granby. Charges of cowardice brought against him were not proved at a court-martial in 1760, but, his dismissal being approved on the ground of insubordination, he was declared unfit for military command, and his name was erased from the rolls of the Privy Council by George II. Sackville's political career had begun in 1741 with his election to represent Dover in Parliament, and he continued as a member of the House from some constituency until 1761, when he was chosen for three constituencies and sat for Hythe. In 1763, after George III became King, his name was restored to the list of privy councilors, and he began to take part in the debates in Commons as a supporter of Lord North. The first actual mark of favor shown him was his appointment as Vice Treasurer of Ireland, a position he held during 1765-66. In 1769 he was declared by some, without much reason, to be the author of the *Junius Letters*. (See J. Jaques's *History of Junius*, 1843.) He assumed the name of Germain in 1770, after the valuable estate of Drayton and £20,000 had been left him by Lady Elizabeth Germain (1680-1769), a friend of Dean Swift and the widow of Sir John Germain (1650-1718), an English soldier of fortune. From 1775 to 1779 he was Lord Commissioner of Trade and Plantations, and Secretary of State for the Colonies until the resignation of Lord North in 1782. In charge of the actual conduct of the war in America, he did much to embitter the Americans against the mother country by his advocacy of harsh measures, by the employment of continental mercenaries and Indians, and by his continued opposition to all propositions looking towards peace. In 1777 he planned the invasion of Canada and Burgoyne's campaign, which turned out so badly. After the fall of the North ministry he was created Viscount Sackville (1782) and retired from public life.

GERMAIN, SAINT See GERMANUS, SAINT.
GERMAN, J. EDWARD (1862-) An English orchestral composer. He was born at Whitchurch in Shropshire and after preliminary instruction under local teachers became a student at the Royal Academy of Music, where he studied from 1880 until his graduation in 1887 as an associate, the rank of fellow being granted him in 1895. In 1888-89 he was director of music at the Globe Theatre, London. After that he devoted his entire time to composition. He wrote an operetta, *The Rival Poets* (1886), two symphonies, considerable chamber music, and incidental music to several of Shakespeare's plays, as *Richard III*, *The Tempest*, *Romeo and Juliet*, *As You Like It*, and *Henry VIII*, by which he has become best known. He has also brought out operas *Merry England* (1902), *The Princess of Kensington* (1903), and *Tom Jones* (1907).

GERMAN BAPTIST BRETHREN. Now known as CHURCH OF THE BRETHREN (qv)

GERMAN BAPTISTS. See BAPTISTS

GERMAN CATHOLICS. The name given to a sect which originated in Germany in 1844 and had a short existence. In that year Johannes Czerski (qv) undertook to found the Christian-Apostolic Catholic Congregation at Schneidemühl in Posen. The confession of faith drawn up by Czerski rejected certain doctrines and practices of the Roman Catholic church, but retained the Nicene Creed, the seven sacraments, and prayer for the dead, it declared the Bible the only sure source of Christian faith. In the same month and year Johannes Ronge (qv) uttered his protest against the exhibition of the holy coat (qv) at Treves, and the following year was called to take charge of a large German Catholic congregation at Breslau. Ronge's confession of faith was far more radical than that of Czerski and had a decided rationalistic tendency. The movement spread with remarkable rapidity, and many similar congregations were formed. In March, 1845, a conference was held at Leipzig and an organization effected. Among the prominent members of this gathering was Robert Blum (qv). The movement was forbidden in Austria and Bavaria. By the end of 1846 there were 60,000 German Catholics, more than half of them in Silesia. A second council was held at Berlin in 1847, at which liberal and rationalistic tendencies were still more marked. The decline of the association was due to two causes—the active part which many of its members took in politics, and the continual controversy between the adherents to the rationalistic confession of Ronge and those who preferred the more evangelical one of Czerski. After the revolution of 1848 it rapidly went to pieces. In 1850 it was united with the Free Congregations (qv). In 1863 Ronge and Czerski attempted to revive the movement by the Religious Reform Union. It is now practically dead. Consult: Gunther, *Bibliothek der Bekenntnisschriften der deutschkatholischen Kirchen* (Jena, 1845); Bauer, *Geschichte der Gründung und Fortbildung der deutschkatholischen Kirche* (Meissen, 1855); Kampe, *Wesen des Deutschkatholicismus* (Tübingen, 1850); Findel, *Der Deutschkatholicismus in Sachsen* (Leipzig, 1895).

GERMAN COLONIES. At the outbreak of the Great War in 1914, the German Colonies, or so-called protectorates, were Togoland (acquired in 1884), Kamerun (1884), German Southwest Africa (1884), German East Africa (1885), German New Guinea (1884), German Samoa (1900), and the territory of Kiaochow (1897). German New Guinea included Kaiser-Wilhelmsland, the Bismarck Archipelago, and the German Solomon Islands, while administratively attached to it were the Micronesian Islands acquired in 1899, viz, the Caroline, Pelew, Marshall, and Mariana islands (except Guam). Total area, 1,140,115 square miles, total population 13,258,000.

The overseas dominions of Germany were attacked at the very beginning of the war and all of them were conquered before the war was over. Togoland was captured in a campaign which lasted just three weeks. It was surrounded on three sides by hostile territory and the British controlled the sea. The initial campaign was begun on Aug. 7, 1914, and on August 28 the German governor surrendered the colony. Kamerun presented a much more difficult problem. Although surrounded by hostile country its vast

size presented a huge obstacle. In 1914 and 1915 the Germans successfully repelled the Allied invasions. Early in 1916, French, Belgian, and British columns closed in and compelled the surrender of the government. The campaign against German Southwest Africa really began when Luderitz Bay was occupied on Sept. 18, 1914. Swakopmund was seized on Jan. 14, 1915. From these two points an attack was directed against Windhoek, the capital. This was entered May 12, and on July 9, General Botha received the surrender of the colony at Grootfontein.

The most important German colony in Africa was German East Africa. Its capture gave the Allies considerable trouble. In 1914 the Germans repulsed every effort of the British to invade it. In September, 1915, the Allies began a determined campaign. The Belgians, French, British, and Portuguese advanced on all sides. All the seaports fell into the hands of the British Fleet. It was not until Nov. 14, 1918, however, that General von Lettow-Vorbeck finally surrendered.

The German possessions in the Pacific fell an easier prey to the Allies than those in Africa. Shortly after Japan's entrance into the war she began a land and sea attack on Kiaochow (Aug. 27, 1914), Germany's possession in China. Land forces captured Tsingtao on November 7, and Kiaochow was in Allied hands. An expedition from Australia and New Zealand captured German Samoa on Aug. 30, 1914. On its return from Samoa the British squadron captured Herbertshöhe, the capital of the Bismarck Archipelago, and, on September 27, took possession of the town of Friedrich Wilhelm in Kaiser-Wilhelmsland (German New Guinea). During September and October Australian and Japanese expeditions seized the remaining German possessions in the Ladrone, Marshall, and Caroline Islands.

The Peace Conference, which closed the war, decided not to return any of the colonies to Germany. The final disposition of them (in the form of mandates) was as follows: in German East Africa the region between Lake Victoria and Lake Tanganyika was given to Belgium, the rest to Great Britain, German Southwest Africa to the Union of South Africa, Togoland, two-thirds nearest Dahomey to France, the rest to Great Britain, Kamerun, mostly to France, a small strip near Nigeria to Great Britain, in Oceania all islands north of the Equator were given to Japan, all islands south of the equator to Australasia. Japan received Kiaochow and Shantung in Asia. For further details see SUPPLEMENT.

GERMANDER from Fr *germandrée*, Sp *camedris*, *cedredo*, from Lat *chamædrys*, wall germander, from Gk *χαμαίδρυς*, *chamadrûys*, germander, from *χαμαί*, *chamâi*, on the ground + *δρῦς*, *drys*, oak), *Teucrium*. A genus of numerous and widely distributed species of plants of the family Labiatæ. The common germander, or wall germander (*Teucrium chamædrys*), often found on ruined walls in Great Britain, has probably been introduced from the south of Europe. It is a small, almost shrubby perennial, with wedge-shaped, ovate, serrate leaves, and whorls of large reddish-purple flowers. It is bitter, somewhat aromatic, and was formerly much used in medicine, particularly as a principal ingredient in a once famous gout medicine called Portland powder. Similar medicinal virtues were ascribed to *Teucrium botrys*, a small annual species common on dry hills in

Germany, having aromatic fragrance and yellow flowers. Cat thyme (*Teucrium marum*), a native of the south of Europe, abounds in a pungent volatile oil, has a camphor-like smell, and, like catmint and valerian root, is greatly relished by cats. It is often used as a sternutatory. Two species are rather abundant in the United States—wood sage, or American germander (*Teucrium canadense*), in low ground in the eastern part of the United States, and *Teucrium occidentale* in the West.

GERMAN EAST AFRICA The largest and most important former colonial possession of Germany. It lies on the east coast of Africa, from lat 1° S to about 11° to 40' S, and from about long 29° E to 40° 40' E, with a coast line of 620 miles. It is bounded on the north by British East Africa, on the east by the Indian Ocean, on the south by Portuguese East Africa and British Central Africa, on the southwest by Rhodesia, and on the west by Belgian Congo. The area is estimated at 384,170 square miles—almost double the size of Germany. The small island of Mafia, off the coast, also belongs to the colony.

Topography and Hydrography Bordering the ocean, the region is a narrow coastal plain formed by sedimentary strata and coral limestone. Behind the jungle-covered plain rises a wide plateau, extending to Tanganyika, from 3000 to 4000 feet in height and comprising over 90 per cent of the country. It is surmounted in the east by the hills and mountains of Usambara, Useguha, Usagara, and other districts, which extend south to the Rufiji River and inland about 300 miles. This mountain region, some of whose peaks are 6000 feet high, is in the northern part well watered, well wooded, and fruitful, and its drainage reaches the Indian Ocean through the Pangani, Rufu, Wami, and Rufiji rivers, while in the south the country is almost a desert. West of the mountains is a wide steppe region, dry and poverty-stricken, shut off by the mountains from the moist southeast trades of the Indian Ocean. The thorny steppe merges gradually into the high fertile plain of Unyamwezi, south of Victoria Nyanza. On the west border of the colony the plateau is broken by the cleft of the Great Rift valley (qv) and also by vertical displacements which have raised the strata west and north of Lake Nyassa into mountains of considerable elevation, some peaks of the Livingstone Mountains reaching 6000 to 9000 feet. The lofty volcanic mass of the Mfumbiro Mountains lies on the northwest boundary. In the north the plateau is intersected by a number of subordinate rifts and has been the seat of volcanic activity. Mount Kilimanjaro, an isolated volcanic peak, rising to a height of 19,720 feet, is the culminating point of Africa.

Climate The climate is tropical and unhealthy, especially along the coastal plain, where malaria prevails. On the coast there are two rainy seasons—from the middle of March to the end of May and from the middle of October to the middle of December; in the interior there is only one rainy season, from November to the end of April. The mean annual temperature is about 78° F in the coast land, and considerably above that in some parts of the interior.

Agriculture, Commerce, etc Agriculture and cattle raising are the chief occupations of the settled natives. Millet is grown in most parts, while wheat, sesame, tobacco, and rice are

confined to certain localities. Bananas are cultivated chiefly on the coast. The German government furthered agricultural development by establishing experiment stations and plantations among the highlands of the northeastern part of the colony, to which the German plantations were almost wholly confined. Nearly all European vegetables thrive in some of these high districts. Hundreds of thousands of coffee shrubs have been reared on the German plantations, the crop thrives, and exports are increasing. The tobacco crop is rapidly increasing, but it is of poor quality and is sold only to the natives and Arabs. Cotton is exported, but sugar and copra are more important. The collecting of India rubber makes steady progress. In 1912 there were 43,617 cattle and 41,647 sheep and goats owned by Europeans, and 3,950,250 cattle and 6,398,300 sheep and goats owned by natives. The chief exports are rubber, copra, ivory, vegetable fibre, and coffee, while the imports consist mostly of provisions, textiles, hardware and iron, and rice. The imports increased from 23,806,000 marks, and the exports from 12,500,000 marks in 1907, to 38,659,000 and 20,805,000 in 1910, and 50,309,000 and 31,418,000 in 1912. The trade, about half of which was with Germany, passes chiefly through the ports of Dar-es-Salaam, Bagamoyo, Pangani, Kilwa, Lindi, Mikindani, and Tanga. The colony had regular steam communication with Germany and Bombay. The three boundary lakes are navigable by steamers. The main roads are good throughout the colony. The Usumbara Railway, from Tanga to Muhara (219 miles), is open to traffic. The Tanganyika Railway, from Dar-es-Salaam, reached Kigoma (about 740 miles), on Lake Tanganyika, in February, 1914. The chief ports are connected by telegraph with Zanzibar and inland points and through the latter with the African transcontinental line.

The native population in 1913 was estimated at 7,659,898, other non-Europeans, as Arabs, Indians, etc, living mainly on the coast, were estimated at 15,000. The white population, Jan 1, 1913, was 5336, of whom 4107 were Germans. The natives are of the Bantu race. The seat of government is Dar-es-Salaam (qv).

History. German colonization on the east coast of Africa began in 1884, when an expedition sent by the German Colonization Society (established in the same year) secured by treaty the territories of Useguha, Nguru, Usagara, and Ukami. This movement was made in secret on account of the enormous influence which Great Britain exercised over this territory. In 1885 the German East Africa Company came into existence, and during 1885-86 succeeded in extending its dominion along the coast from Somaliland to the mouth of the Rovuma, with the exception of the territory around Mombasa, then in the possession of the British. By the Anglo-German agreement of 1886 the northern boundary of the colony was fixed, and the dominions of the Sultan of Zanzibar on the mainland reduced to a narrow strip along the coast. The southern boundary of the colony was fixed in 1887. By a second agreement with Great Britain, in 1890, the Territory of Vitu, then within the German sphere of influence, was exchanged for Helgoland (qv), in the North Sea. The Sultan of Zanzibar renounced his claim to all his mainland possessions for the sum of 4,000,000 marks (\$952,000), and from Jan. 1, 1891, the colony remained under the control of the German government till it was lost in the war. GERMAN EMPIRE. See GERMANY.

GERMAN EVANGELICAL PROTESTANT CHURCH. The name given collectively to a number of independent German churches in the United States, mostly west of the Alleghany Mountains. No general organization of these churches has been instituted, but a union of ministers has been formed, which is called the German Evangelical Protestant Ministers' Association of North America. This body is of comparatively recent origin, although some of the churches whose ministers are affiliated with it are old. It is founded on the basis of the principles of the United church of Prussia of 1817. Its purposes, as set forth in its published organs, are to furnish a worthy representation of the German Evangelical Protestant church in North America, to promote the association of the ministers, for mutual assistance, advancement in knowledge, and greater practical efficiency for their work and for the benefit of their congregations, and to secure the preservation of the independence, while promoting the connection, of the German Evangelical Protestant congregations and ministers. The doctrinal principle of the union is the gospel of the Lord Jesus Christ, the interpretation of which is left to the judgment of the believer, enlightened by the Christian idea. The association is composed of three district associations—those of Cincinnati, of Pittsburgh, and the Western District Association—and is under the management of a central board, or *Behörde*, consisting of a president, a treasurer, a secretary, and three trustees. The congregations have no part in it. It maintains an orphans' home and a home for the aged near Pittsburgh, aids in the support of the Protestant orphans' homes in Cincinnati and St. Louis, and assists other benevolent institutions when required. The periodical organ of the association, the *Kirchenzeitung*, is published monthly at Pittsburgh and Cincinnati. A periodical for youth, the *Christlicher Jugendfreund*, is published semimonthly. The book list of the publishing house at Cincinnati comprises a hymn book and a small number of books of elementary religious instruction, devotional books, and the *Protestantischer Volkskalender*. In 1914 the number of ministers in the association was about 60, some of them having charge of two or more congregations; and the number of members in the congregations was about 35,000.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA, THE. A Church organized Oct. 15, 1840, when six German ministers doing missionary work in Missouri and Illinois met at Gravois Settlement, Mo., and formed the German Evangelical Association of the West. Most of its early ministers had been ordained in the Evangelical church of Prussia, some had been sent out by the Basel and other missionary societies, and a large number of the members of their congregations had been attached to the United Evangelical church in their native land. Other Evangelical unions were organized in other parts of the country and in time were united with this one—the

German Evangelical Church Association of Ohio in 1858, the German United Evangelical Synod of the East in 1860, and the Evangelical Synod of the Northwest and the United Evangelical Synod of the East in 1872. As these unions were effected, the name of the church was changed to Evangelical Synod of the West in 1866, and the German Evangelical Synod of North America in 1877. The doctrinal position of the church, as defined in the declaration in its constitution (sec. 2), is that it "considers itself a part of the Holy Christian Church, and as such does acknowledge the Holy Scriptures of the Old and New Testaments as the only true and infallible guide of faith and life, and accepts the interpretation of the Holy Scriptures given in the symbolical books of the Lutheran and Reformed churches in so far as they agree. In all points of difference the Evangelical Church refers to and abides by the words of the Holy Scriptures, availing itself of that liberty of conscience which, as a component part of the basis of man's ultimate responsibility to God Himself, is the inalienable privilege of every believer." The chief governing body is the General Synod, which meets every four years and is composed of pastoral, lay, and teacher delegates, chosen by the district meetings. The church is divided into 20 districts, which have charge of local affairs, with officers responsible to the General Synod or its president. The districts are the Atlantic, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, New York, North Illinois, Ohio, the Pacific, Pennsylvania, South Illinois, Texas, West Missouri, Wisconsin, Colorado, Washington, and the Mission. The work of home missions is carried on under supervision of the various district boards and the General Board for Home Missions and is aided by the Church Extension Fund. The denomination maintains foreign missions in India, where the communicants and adherents number about 3500. The church property was valued in 1914 at nearly \$14,000,000, and over \$1,000,000 is spent annually for the maintenance of churches. The official organs are *Der Friedensbote* and *The Messenger of Peace*, both published at St. Louis. Formerly nearly all the publications were issued in the German language, but in recent years the publications have been printed in the English language also. The denomination sustains Elmhurst College at Elmhurst, Ill., and the Eden Theological Seminary at St. Louis. Charitable institutions are maintained for orphans, superannuated ministers, and the widows and orphans of deceased ministers. Nine institutions are engaged in deaconess work on the Kaiserswerth model. In 1913 the communicants of the denomination numbered 25,894, the churches 11,026, and the ministers 1038. In addition to the publications mentioned above there are printed at St. Louis the *Theologisches Magazin*, the *Evangelical Herald*, and a number of children's and Sunday-school periodicals.

GERMANIA. An opera by Franchetti (qv), first produced at Milan, March 11, 1902, in the United States, Jan. 22, 1910 (New York).

GERMANIA The general name under which the Romans designated a great part of modern Germany and, in addition, two districts respectively in the east and in the extreme north of Gaul, called Germania Superior (or Prima) and Germania Inferior (Secunda). Germany proper was styled Germania Magna, Germania Transihenana (beyond the Rhine), or Germania Barbara. The boundaries of the region comprehended under these designations were the Rhine and Celtic Gaul on the west, on the east, the Vistula and the Carpathian Mountains, on the south, the Danube, and on the north, the sea, which was divided by the Cimbric Chersonesus (Jutland) into the German and the Suevic (Baltic) seas. Archaeological evidence, such as the discovery of Baltic amber in Mycenæ, points to very early communication between Germany and the Mediterranean lands (See also PYTHIAS). The first occurrence in connection with the history of the people of Germania with which we are acquainted was the appearance of warlike tribes of Cimbri and Teutones in the present Styria, where they defeated the Roman consul Papilius in the year 113 B.C. Eleven years later these tribes again came into collision with the Roman arms, but the result was their signal defeat by Marius. The names "Germani" and "Germania" do not seem to have been appellations in use among the people themselves (consult Cæsar, *De Bello Gallico*, II, 4, Tacitus, *Germania*, 2), and it is probable that the Romans borrowed them from the Gauls, who, it would seem, applied the name "Germani" at first to the group of nations that first invaded Gaul by crossing the Rhine and later to all the peoples beyond the Rhine. The name "Germani" has been connected with a Celtic root meaning "to shout"; the Germani would thus be "Shouters." They accompanied their attacks on their enemies by loud cries. When Julius Cæsar opened his Gallic campaigns (58 B.C.), he found the Germanic nations of the Triboci, Nemetes, and Vangiones in possession of the districts lying between the left bank of the Rhine and the Vosges, while he even encountered a rival pretender to the supremacy of Gaul in the person of Ariovistus, the leader of the Suevic tribe of the Marcomanni (q.v., see also SUEVI). The Germanic peoples west of the Rhine were reduced to subjection by Cæsar with the rest of Gaul, while the Tencteri and the Usipetes, who had invaded Belgium, were driven, together with the Sicambri, across the Rhine to their former settlements by the victorious general, who for the first time (55 B.C.) led a Roman army into Transrhene Germany. The quiet which Cæsar's victories had secured in the Rhenish districts was again so seriously disturbed by the Usipetes and several of the neighboring tribes in the year 16 B.C. that Augustus, who had hastened to Gaul on the outbreak of disturbances, saw that stringent measures must be adopted to keep the Germans in check and sent Drusus at the head of eight legions into Germany (See DRUSUS, 3). The first step of the Roman general was to dig a canal ("*fossa Drusiana*") from the Rhine to the Yssel, by which the Roman galleys could sail from the heart of the continent to the ocean, and so successful were his measures that in the course of four campaigns he had carried the Roman arms as far as the Albis (Elbe), subdued the Frisi, Batavi, and Chauci in the north, and defeated

the Catti of the Mœnus (Main) districts. Drusus, who died 9 B.C., began the series of forts, bridges, and roads which were completed and extended under succeeding commanders. The attempt made by Varus, under the direction of Augustus, to introduce the Roman provincial forms of administration into Germany brought, however, a sudden check to the advance and consolidation of Roman power, for the tribes of central Germany, indignant at this attempted subversion of their national institutions, ranged themselves under the leadership of Arminius (q.v.), a chief of the Cherusci, who organized a general revolt. The result of this movement was the destruction, in the *Salvus Teutoburgensis* in 9 A.D., of the three legions commanded by Varus and the subsequent loss of all the Roman possessions between the Weser and the Rhine. The news of this disastrous event threw the city of Rome into consternation. Germanicus, who was sent forth in 14 A.D. to restore Roman supremacy, would probably have again wholly subjugated the Germanic tribes had he not been recalled by Tiberius in the midst of his victories. From this time forth the Romans ceased their attempts to conquer Germany and contented themselves with repelling the incursions which the tribes made on their frontiers and endeavoring by their influence to foster the intestine disturbances which were perpetually generated through the ambition and jealousy of rival leaders, such as Arminius, Marbadius, and the Goth Catualda. After the murder of Arminius by his own people, the power of the Cherusci declined, while the Longobards (see LOMBARDS) and Catti began to assert a recognized preponderance among the neighboring tribes. Occasional encounters took place between the people of central Germany and the legions who guarded the well-protected Roman boundary line, which extended from the Rhine to the Taunus and thence to the Danube (see LIMES ROMANUS, SAALBURG), and from time to time the Batavi and other warlike tribes of the north and northwest, who, like them, had been brought into partial dependence on the Romans, rose in formidable insurrection, but after Trajan had restored order and strengthened the forts, peace remained undisturbed in the north till the beginning of the third century, while, with the exception of the sanguinary war of the Marcomanni and Quadi under Marcus Aurelius which began about the year 166 A.D., there was a similar absence of hostilities in the south. During this period important towns sprang up in Germany. See AUGSBURG, BONN, COLOGNE, SPEYER, STRASSBURG, TRIER.

With the third century the tide of war turned, and the Romans were now compelled to defend their own empire from the inroads of the numerous Germanic tribes, foremost among whom stood the powerful confederacies of the Alemanni and the Franks. In their track followed, during the next two centuries, successive hordes of the Vandals, Suevi, Heruli, Goths, and Longobards, who soon formed for themselves states and principalities on the ruins of the old Roman provinces. From this period almost down to the establishment of the Western Empire in the person of Charlemagne, the history of Germany is a blank, but the condition of the country when he entered on the possession of his German patrimony showed that since the retirement of the Romans the

lesser tribes had become gradually absorbed in the larger, for on his accession the land was held by a few great nations only, as the Saxons, Frisians, Franks, Swabians, and Bavarians, whose leaders exercised sovereign power within their own territories, and, in return for military services, parceled out their lands to their followers.

The knowledge which we possess of the habits and government of the ancient Germans is principally derived from Cæsar's *Commentaries on the Gallic War* and the *Germania* of Tacitus. According to the Roman historians, the Germans were a people of high stature, fair complexion, and red or yellow hair, endowed with great bodily strength, and distinguished for an indomitable love of liberty. The men delighted in active exercises and the perils of war, and the women, whose chastity was without reproach, were held in high esteem. Each master of a family had absolute power over those of his household. Their habitations were generally separate and surrounded by their several stalls and garners, for, although there were villages whose inhabitants made common use of the fields and woods surrounding them, the Germans seem to have preferred isolated and detached dwellings to aggregate settlements. Towns and cities they long regarded with aversion, as inimical to personal freedom. In regard to their political organization it would appear that several villages formed a "hundred," several hundreds one "gau," and several gaus one "tribe." In each tribe the people were divided into four classes—nobles, freemen, freedmen or vassals, and slaves. The king or chief was elected from among the nobles, but his power was very limited, and the government of the several tribes seems to have been democratic rather than monarchical.

The religion of the Germans, which is shrouded in great obscurity, was based upon myths of the creation of the world, and the existence of gods having the forms and the attributes of a perfect humanity. The different tribes had all their special gods or demigods, who were often their own leaders or chiefs, to whom the attributes of the god to whose worship they were most partial were ascribed. It is generally said that the Germans had neither temples nor statues. Both Cæsar and Tacitus expressly affirm this. Tacitus himself (*Annales*, i, 51) mentions a *templum* of a goddess Tanfana, or Tanfana, among the Marsians, but *templum* may here mean only a consecrated grove. At a later period we find Christian missionaries exhorting the Germans to change their pagan temples into Christian churches, while we also read of the destruction of pagan idols. Nevertheless, the religion of the Germans was mainly carried on in the open air in groves and forests and on heaths and mountains. Although a priestly order also existed among the Germans, each master of a household performed religious services for himself and his family within his own homestead. A knowledge of the will of the gods and the events of the future was sought by divination, from observations of the flight of birds, the rushing of waters, and other similar signs, in the interpretation of which women were thought to be especially skilled. Belief in a future life, and in an abode after death for those who had deserved well in this life, was cherished among the Germanic races, who had a strong faith in retributive justice, whose

sway they believed would be extended over the gods by involving them in a universal annihilating conflict as the punishment of their evil deeds, after which a new world was to arise, guarded by a pure and perfect race of gods. In addition to the higher deities the Germans peopled every portion of space with a class of subordinate beings who pervaded the earth, air, and water, in the shape of elves, nixies, kobolds, dwarfs, and giants. The Roman accounts of ancient Germany are summarized and discussed by Stubbs in his *Constitutional History of England*, vol. 1 (6th ed., 3 vols., Oxford, 1897). Consult also Kingsley, *The Roman and the Teuton* (London, 1887), Henderson, *History of Germany*, vol. 1 (2 vols., New York, 1902), Zeuss, *Die Deutschen und die Nachbarstämme* (Munich, 1837, new ed., Göttingen, 1904), Dahn, *Urgeschichte der germanischen und romanischen Völker* (Berlin, 1880-89) and *Die Könige der Germanen* (Munich, 1862), and the article "Germania" in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

GERMANICUS CÆSAR (15 B.C.—19 A.D.). A distinguished Roman general. He was the son of Nero Claudius Drusus Germanicus (see DRUSUS, 3) and Antonia, daughter of Marcus Antonius and niece of Augustus. He was adopted in the year 4 A.D. by Tiberius, whom he accompanied in the war waged against the Pannonians and the Dalmatians for the purpose of securing the German frontiers after the defeat of Varus (q.v., see also ARMINIUS, GERMANIA). After having been consul in 12 A.D., he was appointed in the following year to the command of the eight legions on the Rhine. On the death of Augustus, in 14 A.D., the soldiers revolted, demanding higher pay and a shorter period of service. Germanicus hastened from Lugdunum (Lyons), to remind them of their duty. The soldiers urged him to seize the supreme power, but he refused. He, however, granted their demands, though his colleague, A. Cæcina, secretly massacred the ringleaders at night. Germanicus now led the legions over the Rhine below Wesel, attacked the Marsi during a nocturnal festival, and destroyed their celebrated precinct of Tanfana (see GERMANIA). In 15 A.D. he made a second inroad into Germany. Proceeding from Metz into the country of the Catti (q.v.), he destroyed their chief town of Mattium (Maden, near Gudensberg). On his return his assistance was implored by the ambassadors of Segestes (always a firm ally of the Romans), who was besieged by his son-in-law, Arminius (q.v.), the conqueror of Varus. This was at once given, and Thusnelda, the heroic wife of Arminius, fell into the hands of the Roman general Arminius, burning with anger and shame, now roused the Cherusci (q.v.) and all the neighboring tribes to war. Germanicus, in consequence, commenced a third campaign. He separated his army into three divisions. The main body of the infantry was led by Cæcina through the country of the Bructeri, the cavalry under another general marched through Friesland, while Germanicus himself sailed with a fleet through the Zuyder Zee into the German Ocean and proceeded up the river Ems, where he joined the others. The united divisions now laid waste the country in the neighborhood of the Teutoburg Forest, and, gathering up the bones of Varus and his legions, which had lain there for six years, buried them

with solemn funeral honors. A victory gained by Arminius induced Germanicus to make a hasty retreat, during which he lost part of his fleet in a tempest. Cæcina, who retreated by land, sustained severe losses at the hands of the pursuing Germans. Before the fleet of 1000 vessels, which Germanicus had built at Batavia, was equipped, he was recalled over the Rhine in 16 A.D. by news of the beleaguering of the recently acquired fortress of Aliso on the Lippe. The Germans were repulsed, and the funeral mound in the Teutoburg Forest, which they had thrown down, was again erected. Germanicus now sailed with his fleet again into the Ems, pressed forward to the Weser, which he crossed, and completely overthrew Arminius in two battles. Nevertheless, he resolved to return, and on his way again lost the greater part of his fleet in a violent storm. In order to prevent this mishap from giving courage to the Germans, he once more, in the same year, marched into the country of the Marsi and dispatched his lieutenant Silius against the Catti. Tiberius now recalled him and bestowed upon him the honor of a triumph, in which Thusnelda appeared among the captives. As Tacitus explains it, to rid himself of Germanicus, whose popularity seemed to render him dangerous, Tiberius sent him, in 17 A.D., with extensive authority, to settle affairs in the East, at the same time appointing as Viceroy of Syria Gnaeus Calpurnius Piso, who everywhere counteracted the influence of Germanicus. However, he arranged matters without much difficulty in Asia. Germanicus died at Epidaphne, near Antioch, Oct. 10, 19 A.D. His friends charged that he had been poisoned, at Tiberius' orders, by the wife of Piso, modern scholars incline rather to the belief that he died a natural death. He was deeply lamented by both the inhabitants of the provinces and the citizens of Rome, whither his ashes were conveyed, and deposited by his wife, Agrippina (qv), in the mausoleum of Augustus. Agrippina herself and two of her sons were put to death by order of Tiberius, her third son, Gaius (afterward the Emperor Caligula), was spared. Of the three daughters who survived their father, Agrippina became as remarkable for vices as her mother had been for her virtues. Besides his splendid generalship, Germanicus was conspicuous for his magnanimity, benevolence, finely cultured understanding, and personal purity of life. He wrote several works of a rhetorical character, which have been lost, but of his poetical works we possess an epigram, a version of the *Phænomena* of Aratus (qv), and fragments of a work of the same character, entitled *Diosemeia*, or *Prognostica*, compiled from Greek sources. Germanicus' literary remains were first published at Bologna, in 1474. The latest edition is that of Breysig (Berlin, 1867). Consult, for extensive bibliography, the article "Iulius, 26," in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914), and Schanz, *Geschichte der römischen Literatur*, vol. II (3d ed., Munich, 1913).

GERMANIUM. A chemical element discovered by Winkler in 1886. Its discovery had been predicted by Mendeléeff in 1871, on the basis of the periodic law (qv), and the fulfillment of the prediction was characterized by Winkler as "an eminent extension of the chemical horizon, a mighty step forward in the domain of knowledge." Mendeléeff had named his to be discovered element *ekasilicon*, on account

of its close relationship to the elements of the silicon group. He predicted that, when discovered, the new element would be found to have an atomic weight of about 72, as a matter of fact, germanium (symbol, Ge) has an atomic weight of 72.5. Mendeléeff predicted that ekasilicon would form two oxides—a monoxide and a dioxide, as a matter of fact, germanium forms the oxides GeO and GeO_2 . According to Mendeléeff, ekasilicon would form a tetrachloride, which would be a volatile liquid, boiling at about 90°C and having a specific gravity of about 1.9, germanium forms a tetrachloride, GeCl_4 , which boils at 86°C and has a specific gravity of 1.887. The dioxide of ekasilicon would, according to Mendeléeff, have a density of about 4.7 and would form a feeble acid, germanium dioxide has a density of 4.703 and forms a feeble acid. The metal ekasilicon itself would, Mendeléeff predicted, be readily obtained by reducing its oxides and would have a specific gravity of about 5.5, metallic germanium is easily obtained from the oxide by reduction with nascent hydrogen and has a specific gravity of 5.469. Thus Mendeléeff's forecast of the physical and chemical properties of germanium was fully corroborated by experimental discovery.

GERMAN IVY, *Hernaria glabra*. A clinging plant often seen in house or garden culture, indigenous to southern Africa, but also occurring in Europe and cultivated in the United States in rockeries to some extent. It bears clusters of small greenish-yellow flowers, and the stems grow 8 or 10 feet long. It is well adapted to window culture. See IVY.

GERMAN LANGUAGE. A sister language of English and Frisian, these three together constituting what is generally called the West-Germanic, or West-Teutonic, division of the Germanic group of the Indo Germanic languages. German, as a general term, includes both the High and Low German dialects. But, High German being the literary language and the language of the educated classes, the term "German" is frequently used as equivalent to "High German."

Area of the German Language. The area of the German language is not identical either with that of the German stock or that of the German Empire. Thus, in the larger part of eastern Germany (the country east of the rivers Elbe and Saale), the German-speaking population is, as far as the race is concerned, largely of Slavic or, in some cases, Baltic origin. In this region the boundary between Slavs and Germans has been subjected in course of time to various changes. At the earliest historic period (at the time when Tacitus wrote his *Germania*) eastern Germany was held by Germanic tribes. Later on, probably in the sixth century A.D., began the inroad of the Slavs, who by the middle of the eighth century had succeeded in crowding the Germans back even beyond the left banks of the Elbe and Saale. From the time of Charlemagne to the present date the Slavonization of the East has been followed by its Germanization, or rather re-Germanization. Except among the Wends or Lusatian-Sorbs around Cöthaus in Brandenburg, and the Lithuanians in the northeastern corner of East Prussia, German is now spoken throughout those parts of Prussia which constituted the kingdom at the time of the accession of Frederick the Great (1740). It is only by many of the geographical names (including such familiar names as

Pomerania, Silesia, Berlin, Danzig, Dresden, Leipzig, etc.) that the former extent of the Slavic settlements in Germany may still be traced. Towards the end of the eighteenth century, however, when in 1772, 1793, and 1795—under Frederick the Great, and his successor, Frederick William II—the Kingdom of Poland was divided between Russia, Austria, and Prussia, a new lot of Slavic inhabitants, and this time mostly of Polish extraction, fell to Prussia (which already possessed a large Polish population in Silesia) as its share in the partition, with the result that at present Polish is the mother tongue of about one-tenth of the whole population of Prussia.

If we turn to other parts of Germany, we meet with Danes in the northern portion of the Prussian District of Schleswig, which until 1864 belonged to Denmark, and with Frenchmen in the western portion of the Reichsland of Alsace-Lorraine, which was retaken from France after the War of 1870-71.

Of the 64,925,993 inhabitants of the German Empire returned in the census of 1910, upward of 4,200,000 were entered as speaking foreign languages. Of this number, nearly 3,330,000 were Poles (including Kassubs and Mazurs), 107,000 Czechs and Moravians, 93,000 Wends, 106,000 Lithuanians, nearly 224,000 French, 141,000 Danes, 80,000 Dutch, 66,000 Italians, and 20,000 Frisians.

German is the vernacular of almost the whole of Luxemburg, of the greater part of Switzerland, and of portions of Austria-Hungary. In Luxemburg the German-speaking population in 1910 amounted to 221,000 (out of a total population of 259,891), in Switzerland to 2,599,154 (or 69 per cent of 3,741,971), in Cislerthan Austria the census of 1910 states the German-speaking population at 9,950,266 out of a total population of 28,571,834, in Hungary at 2,037,435 out of a total population of 20,886,787.

Russia, too, has a German element of some importance. There are many German settlements in the southern Russian provinces, one of them, founded in 1768 (between Kamyshin and Volok on the Volga), consisting of 173 villages and covering an area not much smaller than that of the Kingdom of Saxony. German has, moreover, from the thirteenth century on been the language of the educated classes in the Baltic provinces of the Russian Empire (i.e., in Courland, Livonia, and Esthonia). As regards the numerical strength of the German element, the latest accessible statistics are those of 1883, in which they are reckoned as forming 1.5 per cent of the population of European Russia. If we apply this ratio to the official figures of 1912, when the population of European Russia exclusive of Poland and Finland was stated at 122,551,000, the number of German inhabitants would amount to about 1,800,000.

Outside of Europe the largest number of Germans is found in the United States, whose German-born population amounted in 1910 to 2,501,333. For the city of New York alone the census of 1910 gives the German-born population as 278,137. In addition to these we have the Pennsylvania Germans, or Pennsylvania Dutch, whose dialect is still the vernacular of many districts in the State of Pennsylvania. An exact count of the Pennsylvania Germans has apparently never been made. Their number is by no means identical with that of the Pennsylvanians of German descent. There is a large

German population in Brazil and Argentina, as well as in Canada and other parts of the British Empire, and there are many Germans scattered in all parts of the world.

Altogether German is nowadays spoken by about 80,000,000 people. German thus ranks third in number among the four leading languages of Europe—the first being English, the second Russian, and the fourth French.

Our figures for German do not include the Dutch language. For although Dutch, from a linguistic point of view, represents the Low German branch of the Franconian dialect, it has developed a literary language of its own and therefore is to be regarded as a separate language. In like manner Flemish is left out of consideration.

On distribution, consult Kiepert, *Uebersichtskarte der Verbreitung der Deutschen in Europa* (Berlin, 1887), Nabert, *Karte der Verbreitung der Deutschen in Europa* (Glogau, 1891, in 8 sections), id., *Das deutsche Sprachgebiet in Europa* (Stuttgart, 1893), Hubner, *Geographisch-statistische Tabellen aller Länder der Erde* (51st ed., Frankfurt, 1902).

The German Dialects. From the earliest times German has been divided into several dialects. Of course, these dialects must not be regarded as representing a corrupted form of the written language. On the contrary, they are—in Germany, as elsewhere—the natural and genuine offshoots of the language, whereas the written language represents one of their number artificially restrained in its natural development. It is only by drawing constantly on the dialectic vocabulary and by adapting itself more or less to the grammar of the living dialects that the written language succeeds in sustaining its vitality.

Except in the territory formerly held by the Slavs, the distribution of the German dialects has within the last 1000 years undergone few changes, and a map of the Old High German dialects may be brought up to date with comparatively slight alterations. There is little doubt that dialectic differences were originally the outcome of ethnographical divisions of the German tribes, and since as early as the third century A.D. we meet with tribal unions, such as the Alemanni, the Franks, and the Saxons, we may date back to this time the origin of the corresponding dialects. At first the differences between these dialects were slight, but in the course of several centuries they became more pronounced.

One event in the history of the German language is in this respect of special importance—the second, or High German, shifting of consonants. This second shifting is similar to the first, which had occurred several centuries earlier, so similar, indeed, that the formula known as "Grimm's law" ($q \rightarrow v$) applies, with slight modifications, to the second as well as to the first shifting. There are, however, some important differences. First, while by the first shifting three classes of sounds (the *tenuis*, *media*, and *aspirata*) were concerned, the second is limited to only two classes, the *tenuis* *p, t, k*, and the *media* *b, d, g*. Second, while the first shifting is essentially the same in all Germanic languages, the second, or High German, shifting varies from dialect to dialect. In some of the dialects the shifting of the *tenuis* and *media* is almost as systematic as in the case of the first shifting, whereas in others it is con-

fined to only a few among the six consonants concerned

The second shifting began in the seventh century A.D. It started from the Alps in the most southern region of the German territory and spread with unbroken force over the Alemannic and Bavarian dialects. It then advanced, with diminishing energy, farther north into the Franconian territory, making its entry from the southeast and progressing from there along the Main and Rhine rivers. By the time it had reached Cologne most of its energy was spent, and soon afterward, after crossing the 51st degree of latitude, it came to a stop entirely, without reaching the northern Franconian or the Saxon dialects.

As a result of the second shifting, we have a clearly defined division of the German dialects into three main groups (the second having various subdivisions), according to the degree in which they have been affected by the shifting.

I *Upper German*.—The dialects in which the second shifting has been carried out to its full extent. They are divided into (1) *Alemannic* (west of the river Lech) and (2) *Bavarian* (east of the Lech). The Alemannic is again subdivided into (a) South Alemannic in Switzerland and in the southern districts of Baden and Württemberg, (b) Alsatian, (c) Swabian. The subdivisions of the Bavarian are (a) Upper Bavarian and Austrian, which constitute the main body of the Bavarian dialect, (b) the dialect of the Upper Palatinate (*Oberpfalz*) in northern Bavaria, west of the Bohemian Forest. It may be noted that the German dialects spoken in Hungary (especially in the Transylvanian Saxon Land) belong to the Midland, not to the Upper German type. It may be inferred from their dialect that these Germans are immigrants from western Germany, and that most of them came from the lower Rhine.

II *Midland German*.—The dialects which have been affected by the shifting in a lesser degree. Among these are

(1) *East Franconian* (the dialect of the old Duchy of Franconia Orientalis), which is of special interest, as it exhibits the shifting in the form in which it has found its way into the literary language of Modern German. The tenues *t* and *p* are shifted in Modern German in two different ways, to *z* and *pf* respectively, both at the beginning of a word and after consonants (e.g., Eng *to* = Ger *zu*, Eng *heart* = Ger *Herz*, Eng *penny* = Ger *Pfennig*, Eng *stump* = Ger *Stumpf*), and to *zz* (= Mod Ger *ss*) and *ff* after vowels (e.g., Eng *eat* = Ger *essen*, Eng *ape* = Ger *Affe*). The tenue *k* is shifted to *ch* after vowels (e.g., Eng *make* = Ger *machen*), while it remains unchanged when initial (e.g., Eng *can* = Ger *kann*). The dental media *d* is always shifted to *t* (e.g., Eng *deal* = Ger *Teil*, Eng *side* = Ger *Seite*), whereas the labial and the guttural mediae are not affected by the shifting. North of the East Franconian we find:

(2) The *Thuringian* dialect, which by the colonization of the former Slavic territory has spread to the east over what is now the Kingdom of Saxony, and the Prussian Province of Silesia, giving rise there to the Upper Saxon, or Misnian (*Meissnisch*), and to the Silesian dialects. At an earlier date Thuringian apparently differed but little from East Franconian. But in course of time the differences have become more pronounced, especially so if we compare the Upper Saxon and Silesian with the Franconian dia-

lects. Thus, it is characteristic of the Saxon dialect that it has almost lost the distinction between voiced and voiceless consonants, so that at present the mediae *b*, *d*, *g*, are not distinguished in pronunciation from the tenues *p*, *t*, *k*. West of Thuringian and East Franconian there follows

(3) *Rheno-Franconian* (the dialects of the former Franconian Rhenensis, of the Palatinate of the Rhine, and of the larger part of Hesse). It is chiefly from the dialect of the Palatinate that the Pennsylvania German in America has developed. The shifting differs from that of East Franconian and Modern German, especially in that initial *p* and initial *d* have not been shifted (e.g., Eng *pipe* = Penn Ger *paife*, Mod. Ger *Pfeife*, Eng *deal* = Penn Ger *del*, Mod Ger *Teil*). Still more limited is the shifting in

(4) *Middle-Franconian* (the dialects spoken along the banks of the Moselle and of the Rhine from Coblenz to Dusseldorf). Middle Franconian is characterized by the fact that *t* is kept—in accordance with Low German—in a few pronominal forms, while otherwise it is shifted to *z* or *ss*, as in High German. We find, therefore, e.g., in Cologne *et, dat, wat* = Eng *it, that, what*, but *so* = Mod Ger *zu*, Eng *to*, and *weiss* = Mod Ger *weiss*, Eng *white*.

The Upper German and the Midland German dialects are both comprehended under the term "High German," in distinction from the remaining group, the "Low German."

III *Low German*.—The dialects which have not been reached by the second shifting. These include not only the *Platt*, or *Platt-deutsch*, in northern Germany, but also the dialects of Belgium and Holland (with the exception, of course, of the French and the Frisian districts of the Low Countries). We have two divisions

(1) *Low Franconian*, or the German dialects in the northeastern corner of Rhenish Prussia, and the adjoining Flemish and Dutch dialects in Belgium and Holland.

(2) *Low Saxon*, or the Low German dialects of Westphalia, Oldenburg, Hanover, Brunswick, Holstein, Mecklenburg, and the Prussian provinces of Brandenburg, Pomerania, and East and West Prussia. It is to be noted that east of the Elbe, in the former Slavic territory, the Low German has (except in Holstein, Mecklenburg, and Pomerania) generally undergone a mixture with Midland German dialects.

The lack of the shifting is, of course, merely a negative criterion, and if we comprehend Low Franconian and Low Saxon under one group, we ought not to overlook the fact that the former was at an earlier date more closely connected with the Franconian dialects in Midland Germany. Its vocalism is, in fact, to this day nearer to that of High German and of the Midland German dialects than to that of the Low Saxon.

Low Saxon is subdivided into two distinct dialects, Northern Saxon (or Low Saxon proper) and Westphalian, the latter including in addition to the Prussian Province of Westphalia, also the northern portions of Waldeck and Hesse, the whole of Lippe, and part of southern Hanover (e.g., Osnabrück). The principal difference between the two lies in the fact that in the Westphalian dialects we find a rather complicated vocalism, and generally an abundance of diphthongs, whereas Northern Saxon has few diphthongs and altogether a very simple vowel system.

For a complete list of grammatical treatises and dictionaries on the German dialects down to 1890, consult Mentz, *Bibliographie der deutschen Mundartenforschung* (Leipzig, 1892), for a briefer list, Kauffmann, in Paul, *Grundriss der germanischen Philologie*, 1 (2d ed., Strassburg, 1901-09). Other works of bibliographical importance are Behagel, *Geschichte der deutschen Sprache* (3d ed., Strassburg, 1911), Weise, *Unsere Mundarten, ihr Wesen und ihr Wesen* (Leipzig, 1910), Reis, *Die deutsche Mundarten* (Berlin, 1912), Seemüller, *Deutsche Mundarten* (2 parts, Vienna, 1908). As to poems, fiction, etc., written in these dialects, there is no later attempt at a bibliography than the one made by Carl H. Heermann, in his *Bibliotheca Germanica* (Halle, 1878). Collections of specimens from the various dialects are Firmenich's *Germaniens Völkerstimmen* (3 vols. and appendix, Berlin, 1841-66), very complete and interesting, and Welcker's *Dialektgedichte* (2d ed., Leipzig, 1899), a smaller anthology. Kluge, *Urgermanisch* (Strassburg, 1913) is important for the early history of the language.

A dialect map of the earlier periods is found in Piper's *Verbreitung der deutschen Dialekte bis um das Jahr 1300* (Lahr, 1880). For the modern dialects, the maps by Bremer, in Brockhaus's *Konversations-Lexikon*, vol. iv (new 14th ed., Leipzig, 1901, art. "Deutsche Mundarten"), and by M. Maurmann, in Meyer's *Konversations-Lexikon*, vol. iv (5th ed., Leipzig, 1894, art. "Deutsche Sprache"), will be found the most serviceable. A comprehensive dialect map of Germany was undertaken many years ago by G. Wenker. After the first number had appeared (Strassburg, 1881) the plan of the work was changed so as to give a separate map to the dialectic forms of a single word. In its present form this *Sprachatlas* will probably not be published, but the single maps are deposited in manuscript in the Royal Library of Berlin. By January, 1902, the number of finished sheets (each three forming one map) amounted to no less than 610. This work has originated a new method for the cartography of living dialects. The dialect map in Paul, *Grundriss der germanischen Philologie* (2d ed., Strassburg, 1901), should be consulted, and also F. Wrede, *Deutsche Dialektgeographie, Berichte und Studien über G. Wenkers Sprachatlas des deutschen Reiches* (Marburg, 1908), Wenzel, *Studien zur Dialektgeographie der südlichen Oberlausitz und Nordböhmen* (ib., 1911), Hommer, *Studien zur dialektgeographie des Westerwaldes* (ib., 1910).

Old and Middle High German. In the history of High German three main periods are distinguished. Old High German, from the eighth century to about 1100, Middle High German, from about 1100 to 1500, Modern German, from about 1500 to the present time. These periods apply both to dialects and to the literary language. It is, however, only in Modern German that the literary language has become distinctly separated from the dialects. In Middle High German we have only the beginnings of a literary idiom, while in Old High German there is no trace of a common written language in distinction from the dialects. The dates given are meant only to fix roughly the beginning and the end of each period. There is, in fact, no distinct break in the development of the High German language, but rather a gradual transition from one period to the other.

Old High German is characterized especially

by the preservation of full vowels in its inflectional endings, e.g., *nimu, neman, tagum, hano, hanin, zungün*.

In *Middle High German* these vowels are uniformly weakened to *e*, so that, e.g., the above words appear in the following form *nime, nemen, tagen, hane, hanen, zungen*. Traces of this weakening appear first in the Franconian dialect and become more general towards the end of the eleventh century. Many instances of full vowels, however, in inflectional endings are still found in the Middle High German literature of the early twelfth century, so that the period from about 1080 to 1150 may be regarded as a transition period from Old High German to Middle High German.

There is, as has been stated, in Middle High German no generally accepted literary language as one is found in the written language of Modern German. Thus, Heinrich von Veldeke's language points as clearly to the Low Franconian dialect as does Hartmann von Aue's to the Swabian. But, on the other hand, in the case of Wolfram von Eschenbach, who was born in the Franconian portion of Bavaria, it is difficult to determine how far he used his own dialect and how far he gave the preference to the Swabian. Most of the leading poets of this period lived in that part of Germany where the Upper German dialects were found, especially in Alsace, Swabia, Bavaria, and Austria. Hence it is only natural that there should have developed in southern Germany a tendency to a certain uniformity in the written language as to grammatical forms and literary expression. This does not mean that the Middle High German poems belonging to this group entirely lost their local coloring; it means only that their language rose to a certain extent above the level of the dialects, in that certain dialectic peculiarities were avoided, while others were apparently regarded as unobjectionable. The fact, in any case, remains that in the works of Hartmann von Aue, Gottfried von Strassburg, Walther von der Vogelweide, and also in the *Nibelungenlied* and *Gudrun*, we find essentially the same language. If we were to identify this language with a single dialect, we should probably call it Swabian, though it has been recently proved that it omits several of the salient features of the Swabian dialect of this period. It must therefore be regarded as the literary form of the Swabian dialect, risen to the rank of the literary language of southern Germany generally, though it appears with slight variations in the different provinces.

The period of "classical" Middle High German—in other words, the time of the hegemony of literary Swabian—comes to an end in the latter half of the thirteenth century. From about 1250 we have a transition period, during which the leadership is gradually passing to the Midland German dialects.

Convenient helps to the study of Old High German are Braune, *Abriss der althochdeutschen Grammatik* (3d ed., Halle, 1900), Wright, *Old High German Primer* (Oxford, 1888), and Braune, *Althochdeutsches Lesebuch* (5th ed., Halle, 1902). The most complete Old High German dictionary is Graff, *Althochdeutscher Sprachschatz* (7 vols., Berlin, 1834-46). This excellent work is unfortunately arranged according to roots, but the seventh volume contains an alphabetical index by Massmann.

There are numerous Middle High German

grammars and readers, e.g., Wright, *Middle High German Primer* (2d ed., Oxford, 1899), Paul, *Mittelhochdeutsche Grammatik* (5th ed., Halle, 1900), Michels, *Mittelhochdeutsches Elementarbuch* (Heidelberg, 1900), Weinhold, *Mittelhochdeutsche Grammatik* (2d ed., Paderborn, 1883), id., *Mittelhochdeutsches Lesebuch*, Meyer, *Mittelhochdeutsche Übungsstücke* (Halle, 1909). The standard dictionaries of Middle High German are Benecke, *Mittelhochdeutsches Wörterbuch*, ed. by Müller and Zarneke (3 vols., Leipzig, 1854-66), Lexer, *Mittelhochdeutsches Handwörterbuch* (3 vols., ib., 1872-78), id., *Mittelhochdeutsches Taschenwörterbuch* (6th ed., ib., 1901).

Modern German. It is characteristic of the literary language of Modern German that it is based on the Midland German rather than on the Upper German dialects. The points in which it differs from the Middle High German "Literary Swabian" are especially these: (1) the MHG long vowels *i*, *ū*, *û* (the latter spelled *iu* in MHG) have been changed to the diphthongs *ei*, *au*, *eu*, e.g., MHG *min* = M Ger *mein*, MHG *hūs* = M Ger *Haus*, MHG *hute* = M Ger *heute*, (2) the MHG diphthongs *ie*, *uo*, *ue*, have been changed to the long vowels, *i* (spelled *ie*), *ū*, *û*; e.g., MHG *spiegel* = M Ger *Spiegel* (i.e., *spigel*), MHG *muot* = M Ger *Mut*, MHG *behueten* = M Ger *behuten*; (3) the MHG short vowels *a*, *e*, *i*, *o*, *u*, have been lengthened in stressed "open" syllables (i.e., in stressed syllables ending in a consonant), e.g., MHG *name* = M Ger *Name* (pron *nāme*), MHG *nemen* = M Ger *nehmen*, MHG *gebliben* = M Ger *geblieben*, MHG *oben* = M Ger *oben* (pron *ōben*), MHG *uber* = M Ger *über* (pron *ūber*), (4) initial *s* has passed into *š* (spelled *sch*) before *l*, *m*, *n*, *w*, e.g., MHG *slagen* = M Ger *schlagen*, MHG *smerze* = M Ger *Schmerz*, MHG *sniden* = M Ger *schneiden*, MHG *suacere* = M Ger *schwer*, (5) the difference in the strong preterit between the stem vowel of the singular and that of the plural is generally discarded, e.g., MHG. *ich bleip*, *wir bliben* = M Ger *ich blieb*, *wir blieben*, MHG *ich half*, *wir hulfen* = M Ger *ich half*, *wir halfen*. There are in addition to these differences many others, but those mentioned stand first in importance.

In almost every case we are able to trace the origin and the spread of these changes in the Midland German dialects for a long time before they were incorporated in the literary language. Of special interest is the diphthongization of Middle High German *i*, *ū*, *û*, in that this was originally an Austro-Bavarian peculiarity, which spread from Bavaria and Austria over east Franconia and from here over the neighboring Midland German districts.

The history of the Modern German written language may be traced back to the middle of the fourteenth century, when, under the Emperor Louis the Bavarian (1314-47), the Imperial Chancery adopted German instead of Latin in its official documents. There existed at this time in the different parts of Germany several *Kanzleisprachen*, or official languages. The mutual intercourse between the various centres furnished the basis for greater uniformity, and it is only natural that the language of the Imperial Chancery should have gained a predominating influence. The dialect adopted by the Imperial Chancery was essentially that of the Imperial court, which at the time of the Luxemburg emperors (1347-1437) was stationed

at Prague. It was accordingly a dialect whose consonantism was East Franconian, and in which the Middle High German long vowels *i*, *ū*, *û* had been replaced by the Austro-Bavarian diphthongs *ei*, *au*, *eu*. The adoption of this dialect by the Imperial Chancery led to its introduction, in the second half of the fifteenth century, into the chanceries of the neighboring principalities of Saxony and Thuringia. A further step was its adoption, between 1480 and 1500, by the Meissen and Saxon municipalities and courts and by the universities of Leipzig and Wittenberg. By 1500 it had become, in Saxony and Thuringia, not only the generally accepted official language, but was also largely used in private correspondence and as the written language among the educated classes.

The popular belief which ascribes to Luther the foundation of the Modern German literary language is not well founded. When, in 1522, Luther published his translation of the New Testament, he simply made use of a written language which was by this time pretty firmly established. Luther's own words bear witness to this, for he says in his *Table Talk* (chap. lxix): "I have no particular language of my own in German, but use the common German language so that both High and Low Germans may understand me. I follow the language of the Saxon Chancery, which all the princes and kings in Germany take as their model, all the free Imperial cities and all the courts of princes write according to the Chancery of the Saxons and of our prince. Hence it is the most common German language. Emperor Maximilian and the Elector Frederick, Duke of Saxony, have thus united into one fixed language the German languages of the Roman Empire." This much is true, that Luther's translation of the Bible, his catechisms, his hymns, and his numerous pamphlets were largely instrumental in spreading this language from midland Germany over the whole of the German Empire and in overcoming the obstacles which for a long time militated against its acceptance as the written and literary language of all Germany. The latter result was achieved in the course of the sixteenth and seventeenth centuries, when first (between about 1550 and 1600) northern Germany, afterward southern Germany, and finally Switzerland, joined the movement. It is hardly before about 1750 that the literary language can be said to have received its present form.

Bibliography. General works: Manacorda, *Germania filologica, guida bibliografica per gli studiosi e per gli insegnanti di lingua e letteratura tedesca con circa 20,000 indicazioni* (Cremona, 1909), Breul, *Handy Bibliographical Guide to the Study of German* (London, 1895), Strong and Meyer, *History of the German Language* (ib., 1886), Pietsch, *M. Luther und die hochdeutsche Schriftsprache* (Breslau, 1883), Burdach, *Die Emungung der neuhochdeutschen Schriftsprache* (Halle, 1884), Kluge, *Von Luther bis Lessing* (3d ed., Strassburg, 1897).

GRAMMARS. (a) Historical, Grimm's *Deutsche Grammatik* (4 vols., rev. ed., Berlin, 1870-78) is rather a comparative grammar of the Teutonic languages, Wilmanns, *Deutsche Grammatik*, vols. I and II (2d ed., Strassburg, 1897-99), vols. III and IV have not yet appeared. (b) Practical: Blatz, *Neuhochdeutsche Grammatik* (2 vols., 3d ed., Karlsruhe, 1895-96); Sanders, *Wörterbuch der Hauptschwierigkeiten der deutschen Sprache* (24th ed., Berlin, 1892), a gram-

mar in alphabetical order, Wright, *Historical German Grammar* (London, 1907), Mozer, *Historisch-grammatische Einführung in die frühneuhochdeutschen Schriftsprachen* (Halle, 1909), Sutterlin, *Grundriss der deutschen Sprachlehre* (3d ed., Leipzig, 1911), Thomas, *A Practical German Grammar* (New York, 1905), Bierwirth, *The Elements of German* (ib., 1900), Harris, *German Lessons* (Boston, 1892).

DICTIONARIES (a) Historical and etymological Grimm, *Deutsches Wörterbuch* (Leipzig, 1854 et seq.), will consist of 16 volumes (counted as vols i-xvi), of which 14 have appeared (the last dated 1911), Sanders, *Wörterbuch der deutschen Sprache* (3 vols, ib., 1860-65), the *Ergänzungs-wörterbuch der deutschen Sprache* (Berlin, 1885), by the same author, is a supplement to the preceding, *Moment-lewikon und Fremdwörterbuch* (new ed., ib., 1909); Heyne, *Deutsches Wörterbuch* (3 vols, Leipzig, 1890-95), id., *Deutsches Wörterbuch, Kleine Ausgabe* (in 1 vol., ib., 1896), *Allgemeines verdeutschendes und erklärendes Fremdwörterbuch* (19th ed., Hanover, 1911), Schulz, *Deutsches Fremdwörterbuch* (Strassburg, 1910-11), Kluge, *Etymologisches Wörterbuch der deutschen Sprache* (7th ed., Strassburg, 1910, Eng trans of the 4th ed., London, 1891), Weigand, *Deutsches Wörterbuch*, ed by Hirt (2 vols, Giessen, 1909-10).

(b) Practical Flügel, *Universal English-German and German-English Dictionary* (4th ed., 3 vols, Brunswick, 1891), and Muret, *Encyclopædic English-German and German-English Dictionary* (2 vols, Berlin, 1908), are the two most comprehensive English-German dictionaries. Other works are Flügel-Schmidt-Tanger, *Dictionary of the English and German Languages* (8th ed., Brunswick, 1909), and the new edition, by Schröder, of Grieb's *English-German and German-English Dictionary* (10th ed., Stuttgart, 1898-1902; all the editions of Grieb previous to this one are antiquated), Sattler, *Deutsch-Englisches Sachwörterbuch* (2 vols, Leipzig, 1904-05). Among the one-volume dictionaries the one by Weir (Cassell's *New German Dictionary*, London, 1888, identical with Heath's *New German Dictionary*, New York, 1906), and Whitney-Edgrien, *Compendious German and English Dictionary* (ib., 1905), deserve special mention. For etymology, besides the work of Kluge mentioned above, Hirt's *Etymologie der neuhochdeutschen Sprache* (Munich, 1909) should be consulted.

Spelling and Pronunciation. Germany has an orthographical problem of her own, although a less complicated one than England and America. The spelling of Modern German had become pretty well settled in the latter half of the eighteenth century, when Gottsched (*Deutsche Sprachkunst*, Leipzig, 1748) and Adelung (*Anweisung zur deutschen Orthographie*, ib., 1788) were the chief authorities, and there were only slight changes (due especially to the grammatical works of J. Chr. A. Heyse) in the early nineteenth century. More recently, however, when the works of Jakob Grimm and his followers had led to a better understanding of the history of the German language, and when phonetics had become an essential element in the study of grammar, a more radical reform than that attempted by Heyse was advocated by many scholars. Opinions, however, differed as to whether the reform should rest primarily on an historical or a phonetic basis. The uncertainty in orthographical matters was on the increase, and in 1876 the Prussian government

decided to call to Berlin a conference of German philologists, principals of schools, and publishers. This conference had no immediate practical outcome though its transactions were instrumental in clearing the way for subsequent regulations. Four years later the Prussian Minister of Instruction (Von Puttkamer) introduced in the Prussian schools a uniform spelling, the rules for which are contained in the *Regeln und Wörterverzeichnis für die deutsche Rechtschreibung* (Berlin, 1880). This *Preussische Schulorthographie*, however, could only mean a temporary solution of the difficulty. Its rules were often (e.g., as to the use of *th* and *t*) complicated and generally of such a character as to satisfy neither the conservatives nor the advocates of reform. It became finally necessary for the Prussian government to call at Berlin in 1901 a second conference, in which the southern German states and the Austrian and Swiss governments were also represented. The result is the revised edition (*Neue Bearbeitung*) of the above-mentioned *Regeln und Wörterverzeichnis* (Berlin, 1902). The new regulations are simpler than the former ones, although they imply more radical changes. They have been introduced in both German and Austrian (and also Swiss) schools and have at the same time been adopted by most of the leading newspapers. There is every prospect that for all practical purposes the problem of spelling has been successfully solved for a long time to come.

With the pronunciation of German the case is different. Neither has there been nor is there at present, a generally recognized standard pronunciation, so that in this respect the union of northern and southern Germany is not yet perfected. In southern and midland Germany the difference between the literary language and the dialect is not fundamental enough for the two to be treated as different languages. We find, therefore, that the pronunciation even of cultured people is almost always more or less tinged by their native dialect. The Swabians, the Swiss, the Austrians, and the Saxons are, as a rule, easily recognized by their pronunciation. In northern Germany the Low German dialects and the literary idiom are regarded as different languages. But as High German here has been for several centuries the language of the educated classes, it has again developed local peculiarities and dialectic differences of its own.

It is claimed by many that the language of the theatre—which, if not entirely so, is, on the whole, uniform throughout Germany—must be regarded as dialect-free and as the standard pronunciation. This contention, however, is contradicted by others, who maintain that the pronunciation of the stage, while essentially southern German, is partly based on arbitrary regulations, and that it has no legitimate claim to the position of a standard pronunciation outside of the theatre. It is not very likely that the question of pronunciation will be satisfactorily settled within the present generation.

Bibliography. *Verhandlungen der orthographischen Konferenz in Berlin* (Berlin, 1876), Wilmanns, *Die Orthographie in den Schulen Deutschlands* (2d ed., Berlin, 1887); Hempl, *German Orthography and Phonology*, part 1 (Boston, 1897), Duden, *Orthographisches Wörterbuch der deutschen Sprache* (8th ed., based on the new regulations, Leipzig, 1907), Siebs, *Deutsche Bühnenaussprache* (8th and 9th ed., Cologne,

1910) Other works of value are the following Kluge, *Unser Deutsch, Einführung in die Muttersprache* (2d ed, Leipzig, 1910), Delbrück, *Synkretismus, ein Beitrag zur germanischen Kasuslehre* (Strassburg, 1907), Gutjahr-Probst, *Die Anfänge der neuhochdeutschen Schriftsprache vor Luther* (Halle, 1910), Ladendorff, *Historisches Schlagworterbuch* (Strassburg, 1906), Lambert, *Handbook of German Idioms* (New York, 1910), Buttner, *Die deutsche "Staatssprache"* (Greifswald, 1909), Uhl, *Entstehung und Entzückung unserer Muttersprache* (Leipzig, 1906) For style and versification see Engel, *Deutsche Stilkunst* (10th ed, Vienna, 1911), Kaufmann, *Deutsche Metrik* (new ed by Vilmar and Gien, Marburg, 1907), Saran, *Deutsche Versuslehre* (Munich, 1907), Unser, *Ueber den rhythmus der deutschen Prosa* (Freiburg, 1906) For Low German, consult Grimme, *Plattdeutsche Mundarten* (Leipzig, 1910), and Grube, *Plattdeutsches Wörterbuch* (Berlin, 1908), Briaune, *Ueber die Eringung der deutschen Aussprache* (Heidelberg, 1904), Dent, *Deutsche Laute* (London, 1909), a chart of sounds, Piquet, *Précis de phonétique historique de l'allemand* (Paris, 1907), Vietor, *Deutsches Lesebuch in Lautschrift* (Leipzig, 1911), Grossmann, *Practical Guide to German Pronunciation* (New York, 1910), Vietor, *Die Aussprache des Schriftdeutschen* (7th ed, Leipzig, 1909)

GERMAN LITERATURE First Period (600-800). German literature, as distinct from such Teutonic literature as the Gothic Bible translations of Ulfilas, begins after the triumphs of the great migration and the conquest of the Empire. Forces that had been engaged in the struggle for dominion turned, about the year 600, to the glorification of the nation's heroes, almost at the same time that similar conditions were forming the Anglo-Saxon epic in England. But these songs of warrior gods and heroes are now wholly lost, except a few late recorded fragments, such as the *Hildebrandslied*. Then, with the segregation of the High Germans and their partial conversion, literary activity was largely absorbed by the Church and its interests and from having been national became general, catholic. That there must have been a considerable body of German poetry in this period, both in Upper and Lower Germany, is made probable by allusions in Latin authors. The central figures around whom the saga cycles gathered were Ermenrich (Ermanaricus), a Gothic king of the fourth century, Theodorich the East Goth, Attila the Hun, the Burgundian Gunther (Gundicarius), and, probably a little later and farther to the north, Siegfried, whom some, however, have thought possibly identical with the Arminius who defeated the Roman legions under Varus. All these sagas, or elements from them, seem to have been connected with one another before the close of the first period. The number of these epic songs was sufficient to suggest to Charles the Great the possibility of collecting them, and he gave orders to that effect. Of the result no trace has survived.

Second Period (800-1100) General Character—The new temper shows itself in visions of judgment (*Muspilli*), lives of saints, epic gospel narratives (*Heland*), or the gospel harmonies of *Otfrid*, with an occasional monastic excursion into the political field (*Ludwigslied*). But already under the Ottos the national spirit was reviving, and Frederick Barbarossa made the people once more conscious of a national

mission that found a literary impulse in contact with the culture of the West and South through military expeditions and of the East through the Crusades. This appears first in the religious epics of the eleventh century (*Judith*, *Exodus*), legends of the various Marys, and episodes in the life of Christ. German literature of this period hardly equals in interest or literary value that produced in contemporary England or France, but there are signs, especially at the close of the eleventh century, of a refining of the national taste.

Of political ballads we have first the *Ludwigslied*, written late in the ninth century to celebrate a victory of Louis III over the Normans and a song celebrating the reconciliation of Otto I and his brother Henry, and there are also clear traces of others on the romantic adventures of the rebellious Duke Ernst of Swabia, a popular hero for his resistance to Conrad II. A long Latin epic on Walter of Aquitania (the *Walthariuslied*), telling of his flight with his bride from the court of Attila and his combat with King Gunther at Worms, attests a German original. In all these the native spirit dominates, as the old pagan superstitions do in a few songs, such as the Merseburg incantations. But, as is natural, the chief survivals of the writings of this time are from the poems with which churchmen sought to supplant the older sagas and to tame the national spirit. Best of these is the Low German or Old Saxon *Heland* (Saviour), written in alliterative verse, apparently by a Saxon and at the request of Louis the Pious. The gospel narrative is followed, but Christ becomes a German prince, the disciples are His thanes, and the local color is often naively Teutonic. Obfried's *Krust*, with the same theme, is High German and therefore more sophisticated, more didactic also. It is the first German rhymed verse. The *Muspilli*, which is Bavarian, is of a more independent fancy in its apocalyptic vision, it retains the alliteration of the saga epic and mingles Christian and pagan elements in a way that strikingly illustrates the popular religious conceptions of High Germans of the ninth century. The most noteworthy German writer in Latin of this period was Notker Labeo (died 1022), a philosophic monk of Saint-Gall, a translator of Aristotle and Boethius. The first and second periods are usually called Old High German.

Third Period (1100-1300) General Character—The effect of the Crusades was twofold. They revived epic memories of Charlemagne and Roland and of the triumphs of Alexander. The response in Germany was immediate. Before 1130 there was a *Rolandlied* and an *Alexanderlied*. Tales of German adventure soon followed (*Rother, Herzog, Ernst, Orendel*). Political, intellectual, and literary horizons widened together under the rule of Frederick II, and German literature blossomed into its first classical period. Growing ever more self-conscious, more national, during the closing years of the twelfth century, it greets us on the threshold of the thirteenth with its *Iliad*, the *Nibelungenlied*, and its *Odyssey*, the *Gudrun*. In these folk epics the people speak, meantime the court circle is giving us the philosophic epics of Wolfram von Eschenbach, the popular poetic tales of Gottfried of Strassburg and Hartmann von Aue, the stirring political songs of Walther von der Vogelweide, and the melodious chorus of the Minnesingers.

The forerunners of these court poets were Lambrrecht, Conrad, and Heinrich von Veldeke. Their successors show a rapid decline due to overproduction and artificiality. Literature begins to yield in interest to history, form to matter, and lyric poetry follows close in the wake of the epic decline, so that by 1300 chivalrous love poetry is dead in Germany. There is in the treatment of the chivalric epics the same confusion of persons and their dates that is indicated in the remains of the earlier period. It was an age of awakening that found its first strong national voice in Heinrich von Veldeke, and it is not by chance that the recognition of his poetic primacy is associated with the Whitsuntide of 1284, when 70,000 German knights gathered at Mayence as guests of Barbarossa at the knighting of his sons. That event was an epoch in the national life, and the place that Veldeke won there by his *Eneide* marked no less an epoch in German heroic verse. But from this time Latin sources of inspiration proved less congenial than the Franco-Celtic, and from that time the court epic deals prevalingly with legends of Arthur, of the Grail, and of Charles the Great.

The masterpieces of the third period are embraced within 30 years (from 1190 to 1220). Here is found the work of Hartmann von Aue (q.v.), Gottfried von Strassburg (q.v.), Wolfram von Eschenbach (q.v.), and Walther von der Vogelweide (q.v.). Here, too, belong the popular epics *Gudrun* (q.v.) and the *Nibelungenlied* (q.v.). The outburst was natural and spontaneous, all classes shared in it. The *Heldenbuch*, compiled and in part written in the fifteenth century by Kaspar von der Rhon, is but a working over of the epic wealth of this earlier period. And among the Minnesingers the great Walther had worthy though unequal compeers in Heinrich von Morungen, Reinmar der Alte, and Gottfried von Neifen. Beginning in imitation of the troubadours, they attain soon to a genuine expression of lyric emotion, and to originality of form which is sometimes artificial, but seldom without witness to a sense of beauty and a keen appreciation of melody, which is as surprising in the suddenness of its diffused manifestation as it is in the speed of its decline.

With the second quarter of the thirteenth century artificiality gains the upper hand in Ulrich von Liechtenstein (died 1255), and vulgarity in Neidhard von Reuenthal (died 1240), and in Tannhäuser (died 1270) the dignity of lyric poetry is sacrificed wholly to a rather coarse spirit of comedy. The seriously minded express themselves didactically. Here, again, the best are first. Freidank's *Bescheidenheit*, the *Walsche Gast* of Thomasin von Zirclære, show a lofty ideal of morality not without a touch of enthusiasm. Their successors—Reimar von Zweter, Heinrich Fruenlob, Hugo von Trimberg, the anonymous collection *Der Wilsbecke*, and the didactic *Krieg auf der Wartburg*, a supposed tournament of poets of an earlier age—all tend to the commonplaces of "proverbial philosophy." This change marks a shifting in social ideals. Knighthood had become less important, knights less able, perhaps less willing, to be patrons of song. The Minnesingers (q.v.) are becoming Meistersingers (q.v.). Nuremberg, a trading city, is to become the literary centre, and to apply to poetry the commercial and economic spirit by which it had won political recognition. Prose begins to claim a place in the sermons of

Brother Berthold (died 1272), of Regensburg, the greatest orator of the century, and codes of local law, *Sachsenspiegel* and *Schwabenspiegel*, are formulated in the mother tongue.

Fourth Period (1300-1624) In Germany as in France the fourteenth century shows a shifting in political life that is reflected in literature. Its beginning is aristocratic, at its close it is as distinctively bourgeois, though artificial still. This shifting is marked by the rise of the free cities and their literary guilds and Meistersingers. This is the century also of the founding of the first five German universities—Prague (1348), Vienna (1365), Heidelberg (1387), Erfurt (1392), which exist to-day, and Cologne (1388), since abandoned—whose influence was more favorable to scholasticism than to literary art. Life grew more serious, more realistic. The drama is its chief field (Hans Sachs). Social and political satire is cultivated (*Reinhart der Fuchs*). Didactic poetry (Sebastian Brant) and prose narrative (*Eulenspiegel*) are often crassly realistic. The scholar-hip of Germany expresses itself chiefly in Latin. "This whole period, extending into the seventeenth century, produced no poetic work of art that could satisfy even elementary demands in purity of form" (Scherer).

In prose, on the other hand, the early fourteenth century counts three great preachers—Meister Eckhart (died 1328), Heinrich Suso (died 1366), and Johannes Tauler (died 1361)—mystics all. Eckhart was distinguished for the boldness and originality of his speculations, Suso for his chivalrous, if not quixotic, devotion to transcendental truth, Tauler for the sanity of his sanctity. All found readers, and each in his way helped to prepare Germany for the Reformation and for Luther. Narrative prose chronicles were now written in German and lay open to all readers. The Limburg Chronicle (1336-98), the Alsace Chronicle (1386), and the Thuringian Chronicle (about 1430) have some literary as well as historical significance, and suggest the gradual preparation of Germany to welcome and use the invention of printing. With it came the revival of classical studies. New universities were founded in the course of the fifteenth century at Rostock, Greifswald, Tübingen, and Leipzig. The Humanists, though they wrote almost wholly in Latin, became a force to be reckoned with in German culture. The restlessness of the people under the tyranny of princes and the abuses of the Church is witnessed by swarms of little tales in prose and verse, *Volksbücher*, miracle plays, Shrove Tuesday plays (*Fastnachtsspiele*), and polemic satire, of which the most striking examples are Thomas Murner and Geiler von Kaysersberg, both popular preachers. In such a period Emperor Maximilian's (died 1519) attempt to revive the taste for romance by the autobiographic *Weiskünig* and by *Theuerdank* (written at his suggestion by Melchior Pfintzing) was foredoomed to failure.

The literature of the Reformation period in its intensity of purpose sacrifices all charm and grace of form. It is a literature of combat, direct, trenchant. Luther's Bible is its great monument. To this literature Germany owes the inestimable advantage of a common speech. Ulrich von Hutten is the satirist of the Reformation in verse and dialogue, ardent, bold, an enthusiast of political and religious emancipation. He was chief among the authors of the cleverest satire of

the period, the *Epistolæ Obscurorum Virorum* Allied to Hutton in aim, but with greater scholarship, was Johannes Fischart, translator of Rabelais, with whose spirit he had a strong affinity, preferring prose to poetry as a vehicle of thought and molding words to his purpose with singular freedom. Other prose writers of the sixteenth century were the artist Dürer (qv), the historians Thurnmeier (died 1534), Sebastian Franck (died 1545), and the Swiss Tschudi (died 1572), the Catholic theologian Agricola (died 1566), more noted for his collection of German proverbs, the Protestant Reformer Zwingli (died 1531), and later the successors of the religious mystics, Johann Arndt (died 1621) and Jakob Boehme (died 1624).

In poetry the sturdiest figure of the Reformation period is Hans Sachs (qv), who, as well as Fischart, wrote secular verse also. *Reineke Fuchs* was imitated by Rollenhagen in *Der Froschmeuseler*. The drama was very widely cultivated as a means of polemic and popular appeal alike by the Catholics and Reformers, the Humanists and the vulgar. The noblest poetic expression of the time is, however, its religious lyric. Many hymns of Luther, a few of Hans Sachs, Nicolaus Hermann, Paul Ebers, and Philip Nicolai, still survive in popular use. These hymns were second only to Luther's Bible in their appeal to the national heart.

Fifth Period. From Opitz to Klopstock (1624-1748). The recreation of literature after the Thirty Years' War was begun in the pedantic spirit of Opitz by a literary society of university men, chiefly at first in Hamburg and Leipzig. The names that emerge from the general mediocrity are those of the religious poet Gerhardt (1607-76), the novelist Grimmelshausen (1625-76), and towards its close the critic Gottsched (1700-66), whom this period leaves engaged in a controversy with the heralds of the new period, Bodmer (1698-1783) and Breitinger (1701-76) at Zurich, as to whether French or English poets were the more worthy of imitation, since it was admitted that one must imitate somebody. This period closes, or rather the classical period begins, with the publication of the first cantos of Klopstock's *Messias* (1748).

The Thirty Years' War deferred the development of the national consciousness which the Reformation had promised. For political or social aspirations the conditions were unfavorable, as they were also to the spread or even the maintenance of culture. It was natural that men of a literary cast of mind should take refuge in the consolations of pietism and should express their emotions in religious lyric. Besides Gerhardt the chief Protestant hymn writers of the seventeenth century are Johann Rist (died 1667), Joachim Neander (died 1688), and Louise of Brandenburg, wife of the Great Elector (died 1667). The best Catholic lyricist is the Jesuit Friedrich Spee, whose work belongs to the war period, for he died in his prime in 1635.

Secular poetry either sinks into vulgarity or loses touch with the people through academic affectations. First of the pedantic academics was the Fruchtbringende Gesellschaft, formed on the Della Cruscan model under the patronage of Leopold of Anhalt-Dessau (1617). This found fashionable imitation, and even in bourgeois Nuremberg the Pegnitzschäfer displaced the ancient order of Mastersingers in popular regard. The first noteworthy poets to arise in these academic schools were Weckherlin (died 1653)

and Opitz (died 1639). The appearance of the latter's prosodical treatise, *Von der deutschen Poeterey* (1624), is sufficiently epoch-marking to form the starting point of a period. It was the trusted guide of several generations of verse makers. Among his followers, the Silesian school, the chief are Paul Fleming (died 1640) and Andreas Gryphius (died 1664), who extended the principles of Opitz to the drama and was first to introduce the "regular" five-act tragedy to Germany. To the Silesian school may be assigned also the epigrammatist Logau (died 1655) and the psalmist Joachim Rachel (died 1699). The Low German humorist Laurenberg (died 1659) may be named also, and Philip von Zesen (died 1689), who founded in Hamburg an academic literary association, Deutschgesinnte Gesellschaft, to cultivate linguistic purity.

The first Silesian school, the purists, was succeeded by a second, the euphuists, or better, "Marinists," disciples of the extravagant Italian stylist Marino. The first impulse to this aberration came from Nuremberg and the Pegnitzschäfer. Its noteworthy names are Hoffmannswaldau (died 1679) and Lohenstein (died 1683). A little later French influence asserts itself, and Boileau finds disciples of his *Art poétique* in Canitz (died 1699), Besser (died 1729), and König (died 1744).

Of the prose of this period Grimmelshausen's *Simplicissimus* (1668) has almost alone asserted successfully a right to live. But besides this satirical novelist of the Thirty Years' War may be named Moscherosch (1601-69), for his imitation of the satires of Quevedo, the historians Sigmund von Birken and Gottfried Arndt, the Persian traveler Olearius, the eccentric Protestant pastor Schupp, and the priest Abraham a Sancta Clara, and the voluminous but unreadable romance writers, Buchholtz, Von Ziegler, and Duke Anton Ulrich of Brunswick, to be followed by multitudinous "Robinsonaden," in imitation of Defoe's masterpiece.

As before the Reformation, so at the turn of the century, it is the preachers and religious, metaphysical, or pietistic thinkers who give the first promise of intellectual revival. With the pietists Spener (1635-1705) and August Hermann Francke (1663-1727) comes Leibnitz (1646-1716), the brilliantly original philosopher, who wrote as well in German as in French or Latin. More prosaic was his disciple Wolf (1679-1754), who wrote in German, and the popularizer Thomasius (1655-1728), editor of the first German magazine and commendable for his successful agitation against the juridical persecution of witchcraft. Meantime Nature was timidly reasserting her rights in poetry in the epigrams (1697) of Wernicke, and the lyrics of Gunther (1695-1723), while Brockes (1680-1747) directed the attention of his countrymen from the French to the English poets by precept and by example. He translated Thomson's *Seasons*. A revival of classical studies may also be noted, but it is to England that the literary youth of Germany is looking at the close of this fifth period.

Sixth Period. From the *Messias* to the death of Goethe (1748-1832). The reign of Frederick II represents a progress in German letters and æsthetic taste that is hardly paralleled in history. When he came to the throne (1740), Herder (1744-1803), Goethe (1749-1832), Schiller (1759-1805), and Richter (1763-1825)

were not yet born, Wieland (1733-1813) was a child of seven, Lessing (1729-81) a boy of 11, Klopstock (1724-1803) a youth of 16, Gellert (1715-69) a young man of 25. When he died (1786), Lessing had closed his epoch-making career, Wieland, Herder, and Klopstock had passed their zenith, Goethe had completed the first period of his unchallenged mastery, and Schiller was becoming his worthy compeer. Here, as in the third period, a revival of national pride led to a revival of national literature. The Seven Years' War made Prussia a rallying point of German national feeling, such as had not existed for centuries.

Noteworthy poets contemporary with the youth of Klopstock are the descriptive, didactic, and scientific Haller (1708-77) and the genial narrative and lyric verse writer Hagedorn (1708-54). The Leipzig school of criticism, led by Gottsched (1700-66), continued its conservative protest alike against the Anglophile school of Zurich, headed by Bodmer (1698-1783) and Breitinger (1701-76), and the amiable and popular Gellert (1715-69), chief representative of the younger writers of Leipzig. Noteworthy among the forerunners of the classical period are the satirist Rabener (1714-71), the epigrammatist Kastner (1719-1800), the essayist Cramer (1752-1807), imitator of Steele, and C. F. Weisse (1726-1804), first to make successful literary appeal to German youth and childhood.

The new literary life is first fully felt in Gleim's (1719-1803) *Lieder eines preussischen Grenadiers* (1758). Associated with Gleim in what is known as the Halle school were Uz (1720-96) and Gotz (1721-81), the literary connection with these of the poet of nature, Ewald von Kleist (1715-59), of Ramler (1725-98), a martial lyricist, of Holtz (1748-76), and of the idylist Gessner (1730-87), is less intimate. The religious lyric tradition is meantime continued by Von Zinzendorf (1700-60).

Klopstock meantime gave copious utterance to the subjectivity and sentimentalism of his generation, but did more for poetic technique than for public taste. The whole tendency of Frederick's influence, direct and indirect, was to turn away from sentimental enthusiasm and pietistic mysticism towards realistic study and practical activity. This appears strikingly in the popular philosophic movement, which derives in part from the French encyclopædists, but more from Shaftesbury and Locke. Its leaders were Moses Mendelssohn (1729-86) and Friedrich Nicolai (1733-1811), both of Berlin, with whom it is convenient to associate Thomas Abbt (1738-66), Georg Sulzer (1720-79), and Johann Engel (1741-1802). Among the popular historians Moser (1720-94) deserves note, and in art criticism Johann Winckelmann (1717-68) and Christian Gottlieb Heyne (1729-1812).

All these belong in their cast of mind to the forerunners of the classical generation. The full force of the inspiration and emancipation that came from the triumphs of Frederick II to the German literature that he affected to despise first appears clearly in the development of the genius of Wieland (1733-1813), who in educating Duke Karl August of Weimar gave the new literature a genial home and kindly fostering. Meantime the sterner spirit of Lessing was breaking down and building up in æsthetics the drama, philosophy, and religion.

The authors and scholars of Weimar and the neighboring Jena entered into his labors through Herder (1744-1803), while the young Goethe brought hither the fresh sap of the springtide of "Stoim and Stress" to be clarified and strengthened before it was itself revived by Italian naturalism. But the effervescence is in no way confined to Weimar or to Lessing and Goethe. One feels it seething in the young Schiller, in Lenz (1751-92), Burger (1747-94), Klüger (1752-1831), Wagner (1769-1812), Leisewitz (1752-1806), and in the multitude who thought themselves geniuses of a *Gemezeit*. Of cardinal importance to the writers and the æsthetics of the succeeding decade was Kant (1724-1804), by his *Critique of Pure Reason* (1781), who, as well as his successors, Fichte (1762-1814), Schelling (1775-1854), Hegel (1770-1831), rivaled the writers of imaginative literature in their claim on the attention of all serious minds.

With Goethe's return from Italy (1788) there comes a movement towards classicism, order, correctness, repose, or at least restraint. In inaugurating this Goethe continues the work of Lessing, and after six years wins the cooperation of Schiller. A classical school is formed, while around these play the chartered libertines of genius, with Richter (1763-1825) as their leader, and usher in the Romantic school, whose rise and decline Goethe lived to witness. The history of this school resolves itself into a struggle to turn the objective idealism of the classicists into a subjective one, that set the imagination to overcome reality. To realistic and plastic antiquity they opposed the fantastic Middle Ages and the opulent fancies of the East. In philosophy this school substitutes the mystic or ironical idealism of Fichte and Schelling for the rationalism of Kant. The leaders here are the Schlegels (q.v.), the Brentanos (q.v.), Novalis (q.v.) (1772-1801), Von Arnim (q.v.) (1781-1831), Tieck (q.v.) (1773-1853), Eichendorff (q.v.) (1788-1857), Fouqué (1777-1843), Chamisso (q.v.) (1781-1838), Hoffmann (q.v.) (1776-1822), and on the borderland of the movement the dramatist Heinrich von Kleist (q.v.) (1777-1811), the Platonic theologian Schleiermacher (q.v.) (1768-1834), the novelist Hauff (1802-1827), the patriot poet Uhland (q.v.) (1787-1862), and the brothers Grimm. Several of these outgrew their romanticism, and when Goethe died it had become more a thing of the past than even the classic realism against which it had rebelled. Heine claimed justly to be at once the last Romantic lyricist and the first of the modern school. Among the lesser writers of the turn of the century there may be named the once famous idylist and still respected translator Johann Voss (1751-1826), the poet Mathias Claudius (1740-1815), the sentimentalist Jung-Stilling (1740-1817); the lyric imitators of Schiller, Matthiesson (1767-1831) and Salis-Seewis (1762-1834), Platen (1796-1835) as master of metrical technique, the popular and prolific dramatists Iffland (1759-1814) and Kotzebue (1761-1819), the philosophical sentimentalist Friedrich Jacobi (1743-1819), Werner (1768-1823), who earned transitory fame for "tragedies of fate" and found imitators in Mullner (1774-1829), Houwald (1778-1845), and even the young Grillparzer (1791-1872), the patriot poets Korner (1791-1813), Arndt (1769-1860), and Ruckert (1788-1866). Among the more distinguished literary scholars of the period may be named the historians Spittler

(1752-1810), Johannes von Müller (1752-1809), Schlosser (1776-1861), Niebuhr (1776-1831), and Von Raumer (1781-1873)

Seventh Period From Heine to Hauptmann (1832-1900) This period, though excluding the earlier work of Heine, embraces that which entitled him to be called "the continuator of Goethe." It was Heine that transferred into the political and social field the activity of Goethe in a literary one and perceived more clearly than any other in Germany the hollowness of inherited social conditions. In an age of democratic upheaval he bore the banner of revolutionary reform, and as he grew more realistic he came more in touch with the questioning dissatisfied spirit of an age that had parted from its old ethical moorings and had not yet found a new anchorage. He was less positive therefore than Goethe, but "incomparably the most important figure of that quarter of a century that follows Goethe's death" (Matthew Arnold). His influence can be seen in almost every field, though what he wrought by lyric poetry has come to be more and more the function of the novel and of drama. The more noteworthy poets of the generation preceding the Franco-German War and the foundation of the German Empire were Freiligrath (1810-76), Von Dingelstedt (1814-81), Kinkel (1815-82), Von Redwitz (1823-91), Anastasius Grün (1810-76), Scheffel (1826-86), F. W. Weber (1813-94), Simrock (1802-76), Jordan (1819-1904), Bodenstedt (1819-92), Lingg (1820-1905), Geibel (1815-84), Fontane (1819-98), and the poet composer Wagner (1813-83)

Fiction in this period shows a blending of that of Wieland, of Goethe, and of Schlegel. But from its beginnings it is, as a result of the French upheaval of 1830 and the Romantic movement there, predominatingly social, especially after the German movement of 1848. The "Young Germany" of 1833-35, begun by Wienbarg, headed by Gutzkow, supported by Laube and Borne, was essentially political. With Heine and the women Rahel Varnhagen, Bettina von Armin, and Charlotte Stieglitz it tended to a strike for social freedom, for "the emancipation of the flesh," and this is strongly marked in the earlier novels of Luise Mühlbach (1814-73), Luise Ashton, Ida Frick, Ida Hahn-Hahn (1805-73), Fanny Lewald (1811-89), and in her younger days Marlitt (1825-87). These emancipationists make of the novel a political pamphlet, though there was some reaction after 1848, fiction turning for a time from the political to the purely literary field, and to the historical novel, of which Alexis (1798-1871), Spindler (1796-1855), Laube (1806-84), and Scheffel (1826-86) were the chief representatives.

The serious drama in the period before the Franco-Prussian War is best represented by Gutzkow (1811-78), Laube (1806-84), Hebbel (1813-64), Moser (1803-67), and Heyse (1830-1914). Melodrama is represented by Friedrich Halm (1806-71), Charlotte Birch-Pfeiffer (1800-68), and Salomon von Mosenthal (1821-77); comedy by Freytag (1816-95) and Benedix (1811-73). The most distinguished critic of the period is Gervinus (1805-71), its best-known historians, Menzel (1798-1873), Von Ewald (1803-75), and later Mommsen (1817-1903), Ranke (1795-1886), Droysen (1808-84), and Ernst Curtius (1814-96). The most renowned scholars of this period were the brothers Jakob (1785-1863) and Wilhelm Grimm (1786-

1859). In formal philosophy its most distinguished names are Schopenhauer (1788-1860), Lotz (1817-81), Ulrich (1806-84), Ueberweg (1826-71), Schwegler (1819-57), Kuno Fischer (1824-1907), and Von Hartmann (1842-1906).

In the generation following the Franco-Prussian War antiquarian fiction was cultivated by Ebers (1837-98), while the tradition of the national and political novel was continued in the work of Dahn (1834-1912) and Freytag (1816-95), Meyer (1825-89), Gottschall (1823-1909), and a numerous group of minor writers among whom Spielhagen (1829-1911) is chief. Romanticism is continued in G. Keller (1819-90), Storm (1817-88), and Marlitt (1825-87), and the naturalistic movement makes itself felt in Heyse (1830-1914), Wilbrandt (1837-1911), Sudermann (1857-), Paul Lindau (1839-), and in its extreme form in Mauthner (1849-), Ring (1817-1901), and Kretzer (1854-), while Jensen (1837-1911) and Marie von Ebner-Eschenbach (1830-) represent a psychologic school, and in Aloisia (Lola) Kirschner (1854-) and Baroness von Suttner (1843-1914) the social and democratic interest is again obvious. As an offshoot of this last, we have the village fiction of Auerbach (1812-82), Anzengruber (1839-89), Rosenger (1843-), and Raabe (1831-1910). Exotic sensation is cultivated by Franzos (1848-1904) and Sacher-Masoch (1835-95), and urban humor by Stinde (1841-1905) and Eckstein (1845-1900). The most powerful writers of fiction during the period are Heyse, Dahn, Ebner-Eschenbach, C. F. Meyer, and Freytag.

The patriotic lyrics of the new Empire were many. One may note Geibel and Redwitz, Becker (1828-91), and Jensen (1837-1911). More detached from politics are Heyse and Baumbach (1840-1905) and the peasant poet Johanna Ambrosius (1854-). The epic tradition is continued by Julius Wolff (1834-1910), and intransigent innovation in epic form is attempted by Biebtreu (1859-), Holz (1863-), Heinrich Hart (1855-1906), and his more talented brother Julius (1859-).

In historical drama, besides Heyse, Wildenbruch (1845-1909), Greif (1839-1911), and Wilbrandt (1837-1911) were striking writers, in melodrama, Ganghofer (1855-), and for the peasant drama, Anzengruber (1839-89). Comedy, largely French in technique and commercial in spirit, was cultivated by L'Arronge (1838-1908), Paul Lindau (1839-), Blumenthal (1852-1912), and the late-awakened genius of Moser (1825-1903). The national patriotic drama was represented by Wildenbruch (1845-1909). The greatest of modern German dramatists, democratic and somewhat socialistic in tendency, naturalistic in technique, are Sudermann (1857-) and Hauptmann (1862-), but Halbe (1865-), Fulda (1862-), Schnitzler (1862-), and Hofmannsthal (1874-) are also well known. Among lyric poets Liliencron (1844-1909), Dehmel (1863-), George (1872-), Busse (1872-), and Agnes Miegel (1879-) have become prominent. Among novelists are to be noted Isolde Kurz (1853-), Helene Böhlau (1859-), Clara Viebig (1860-), Von Polenz (1861-1903), Freyssen (1863-), Ricarda Huch (1867-), Zahn (1867-), Bartsch (1873-), and Mann (1875-).

Bibliography Of histories of German literature in German, the most readable is Scherer

(10th ed, Berlin, 1905, Eng trans, London, 1906) Consult also Bartels, *Geschichte der deutschen Literatur* (Leipzig, 1902), Koberstein, *Grundriss zur Geschichte der deutschen Nationalliteratur* (5th ed, by Von Bartsch, Leipzig, 1872-74), more compendious Wackernagel (2d ed, Basel, 1879-94) is valuable for its copious references, and Kurz (Leipzig, 1876) for its illustrative extracts German poetry is fully treated by Gervinus, *Geschichte der deutschen Dichtung* (5th ed, Leipzig, 1874), Goedeke, *Grundriss der Geschichte der deutschen Dichtung* (Dresden, 1884-1900) For special periods, see Uhland, *Geschichte der alideutschen Poesie* (Stuttgart, 1865), Hettner, *Literaturgeschichte des 18 Jahrhunderts* (4th ed, Brunswick, 1879-95), Julian Schmidt, *Geschichte der deutschen Literatur vom Leibnitz bis auf unsere Zeit* (Berlin, 1886-96), Haym, *Die romantische Schule* (ib, 1870), Gottschall, *Deutsche Nationalliteratur des 19 Jahrhunderts* (7th ed, Breslau, 1901), Stern, *Die deutsche Nationalliteratur vom Tode Goethes bis zur Gegenwart* (4th ed, Marburg, 1900), Prolls, *Das junge Deutschland* (Stuttgart, 1892), id, *Geschichte des neuern Dramas* (Leipzig, 1880-83), Meyer, *Die deutsche Literatur des 19 Jahrhunderts* (Vienna, 1901), Vogt and Koch, *Geschichte der deutscher Literatur* (2 vols, 2d ed, Leipzig, 1904), Holzke, *Zwanzig Jahre deutscher Literatur* (Brunswick, 1905), A. Biese, *Deutsche Literaturgeschichte* (3 vols., Munich, 1912) Among later English histories the translation of Scherer is still the best, but Francke, *History of German Literature as Determined by Social Forces* (4th ed, New York, 1901), shows critical originality Briefer histories are Bostwick and Harrison, *Outlines* (London, 1883), Sellss, *Critical Outlines* (trans, ib, 1884), Wells, *Modern German Literature* (ib, 1895), Bossert, *Histoire de la littérature allemande* (Paris, 1901), Thomas, *History of German Literature* (New York, 1909), Robertson, *A History of German Literature* (London, 1902); id, *Outlines of the History of German Literature* (New York, 1912); Stroebe and Whitney, *Geschichte der deutschen Literatur* (ib, 1913) Heller, *Studies in Modern German Literature* (ib, 1905), Taylor, *Studies in German Literature* (ib, 1879); MacCallum, *Studies in High German and Low German Literature* (London, 1884), and Lessing, *Masters in Modern German Literature* (New York, 1912), are occasionally useful Brandes, *Main Currents in 19th Century* (new ed, 6 vols, New York, 1906), is a careful and accurate study

GERMAN MEASLES; ROTHELN, RUBELLA. Sometimes also called French measles and false measles The disease is an acute infectious exanthem, characterized by mild fever, enlargement of the lymph glands of the neck, a rose-colored rash of variable distribution, sometimes resembling the eruption of measles, in other cases simulating that of scarlatina The infection is a mild one and not dangerous to life ordinarily, although occasionally malignant cases have been recorded Since its discovery by Hoffman, in 1740, De Bergen in 1752, and Orlow in 1758, many authors have disputed its existence as a clinical entity, classing it as a modified form of measles (q v) It is now, however, accepted as a distinct disease Rubella occurs in epidemics, principally among children It may be transmitted by direct contact or by fomites, but the contagious principle has not been isolated The

incubation period is from 14 to 20 days Treatment is limited, as a rule, to keeping the patient in bed, on a light diet, and administering a mild febrifuge, such as spirits of nitrous ether, and laxatives

GERMAN METHODISTS See EVANGELICAL ASSOCIATION

GERMAN MILTON, THE A title occasionally given Klopstock (q v), author of the *Messias*

GERMANO, jár-ma'nô, SAN A city in south Italy, the name of which was changed in 1871 to Cassino (q v) (Map Italy, F 5)

GERMAN OCEAN See NORTH SEA

GERMAN PLATO, THE A name given to Friedrich Heinrich Jacobi

GERMAN POLITICAL PARTIES. See POLITICAL PARTIES, Germany

GERMAN SEVENTH-DAY BAPTISTS. See paragraph on Baptists, *German Seventh-Day*, under BAPTISTS

GERMAN SILVER. A popular term describing the alloys of copper, zinc, and nickel It is not a compound, but consists of mixed crystals, the freezing-point curve falling regularly from that of nickel to that of copper It was originally made at Hildburghausen, Germany, and had the composition of copper 40 4 parts, nickel 31 6 parts, zinc 25 4 parts, and iron 2 6 parts As this alloy came into more extensive use, different proportions of the ingredients were used As an alloy intended to replace silver, it is made of copper 50 parts, nickel 25 parts, and zinc 25 parts When an exceedingly malleable alloy is desired, the proportion of nickel is reduced to 20 parts, and that of zinc increased to 30 parts A tough and malleable alloy is made of copper 60 parts, nickel 20 parts, and zinc 20 parts German silver is harder than silver and takes a high polish It is used as a substitute for silver in making castings—eg, for bells, candlesticks, and especially as a foundation for plated ware It must, however, be remembered that German silver is readily attacked by weak acids, like vinegar, and that its use at table, unless properly coated, may give rise to poisoning The smaller units of the coinage of various countries have been largely struck from a German-silver alloy, at times containing silver Certain parts of typewriters having hard and constant usage are made of a German-silver alloy containing a small percentage of aluminium *Packfong*, an alloy made by the Chinese, is of similar composition

GERMAN SOUTHWEST AFRICA. The oldest colony of Germany (Map Africa, F 7) Fronting on the west coast of Africa, it is bounded by Portuguese West Africa (Angola) on the north, by British South Africa on the east and south, and by the Atlantic Ocean on the west Estimated area, 322,000 square miles The coast line is about 950 miles long, and almost at its middle is the British port of Walvis Bay, which with the adjacent territory (area, 430 square miles) forms a part of Cape Colony (q v)

Topography Three natural regions are recognized—the coastal region, the highland, and the Kalahari Waste, the western part of which is in the German territory The winds (southeast trades), which are largely from the land, make this an almost rainless area The coast

is bordered by a belt of sand about 10 miles wide, behind which rises a barren steppe from 40 to 50 miles in width. This valueless coastal zone is succeeded by the wide belt of highlands extending from north to south, rising at many points to an altitude of from 3000 to 6000 feet and culminating in Omatako Mountains (8800 feet). The eastern part of the highlands slopes gradually to the Kalahari Desert (qv), with which it merges. Three harbors are of commercial importance—Walvis Bay, which belongs to Great Britain, Angra Pequena, and Swakopmund (the mouth of the Swakop River), which is the harbor most important for German interests, because it is through the valley of the Swakop that the highland—the valuable part of the country—may most easily be reached. The only perennial rivers are the Cunene and Kunene, on the northern boundary, and the Orange, on the southern boundary. The climate, except in the extreme north, is healthful. The highlands are warmer than the coast, and although the uplands are very dry, there are many thunderstorms in the warmer part of the year, when the stream beds fill and the parched valleys for a short time are green with verdure.

Agriculture. Many European field crops and vegetables may be grown along the streams and near the wells where the farmers procure water for their tilled lands. While the white population (on Jan. 1, 1913, 14,830, of whom 12,292 were German) is still small, it is larger than in all the other German colonies together and includes over 1000 Boers. Cattle raising is the chief industry of the white immigrants and the natives. In 1913 the live stock included 205,643 cattle, 543,347 sheep, 516,904 goats, 15,916 horses, 13,618 mules and asses, 11,194 karakul, 7772 swine, and 709 camels.

Gold is known to occur, and copper mining is carried on, in 1912, 27,500 tons of copper ore were exported. Diamonds are found in the neighborhood of Luderitzbucht, production in 1912, 766,465 carats.

The commerce of the colony is so far of small importance. The exports, chiefly guano from the coast, cattle, skins, hides, copper ore, and ostrich feathers, increased from 32,396,000 marks in 1907 to 44,344,000 in 1910 and then declined to 32,499,000 in 1912. The imports, principally foodstuffs, iron and iron products, textiles, beer, tobacco, etc., increased from 1,616,000 marks in 1907 to 34,692,000 in 1910 and 39,035,000 in 1912. All but a small part of the trade, which passes chiefly through the port of Swakopmund, is with Germany. The transportation facilities are limited. In the interior the bull cart is the chief means of transportation. A main road runs from north to south and is connected with the coast. Though the means of communication are inadequate, German Southwest Africa has nearly as much railway as German East Africa, Kamerun, and Togo together. At the end of 1913 there were in operation 2104 kilometers (1307 miles), divided among four lines: the Otavi Railway, 671 kilometers (417 miles), Swakopmund-Windhuk Railway, 382 kilometers (237 miles), Northern Railway, 506 kilometers (314 miles), Southern Railway, 545 kilometers (339 miles). There are internal telegraph lines, and communication with Europe is effected by means of the Cape and Mossamedes cable, which touches at Swakopmund. A regular steamship line connects Swakopmund and Hamburg. Wind-

huk, the seat of government, and Otavi are among the most promising settlements.

The administration is in the hands of a governor, assisted by district officers. In 1913 a legislative assembly, half elective and half appointive, was established. Prior to the late native uprising there was a colonial army of 800 men, exclusively Germans, in the early part of 1906, about 14,500 men were engaged in suppressing the rebellion, but a large number were later withdrawn, in 1913 the police and military force consisted of about 3000 men. For the year 1913-14 the budget balanced at 32,791,672 marks, of which colonial receipts amounted to 18,164,832, and Imperial subvention 14,626,840, in addition, loans for extraordinary expenditure amounted to 21,350,000 marks. The native population in 1913 was estimated at only 81,000, other non-European population, 3000, whites, 14,830, of whom 12,292 were German. The natives are sharply divided from one another by the topographic aspects of the interior. Bantu tribes (Ovambo, Herero, and others, the Herero being greatest in number and power) inhabit the mountain regions of the north, Damara the central part, and Hottentots the southern plateaus (Nama Land). A sparse population of Bechuana and Bushmen dwell on the plains of the Kalahari Desert.

History. In 1883 the German merchant Luderitz, of Bremen, established a trading station at Angra Pequena (now Luderitzbucht) and secured by purchase the surrounding territory, which he named Luderitzland, and which he ceded to the German government in 1884. By treaties with the native chiefs the German government obtained territorial and mining concessions in the interior, and by treaties with Portugal and Great Britain in 1886 and 1890 respectively, the northern, eastern, and southern boundaries of the colony were fixed. By 1898 German supremacy had been practically established over the entire territory. In the fall of 1903 the Bondelzwarts, a Hottentot tribe in the southern part of the colony, rose in rebellion. They were pacified in January, 1904, but the removal of German troops from the north was followed by a formidable uprising of the powerful Herero nation. German colonists were massacred, and the existence of the colony was seriously threatened. Reinforcements were hastily brought from Europe, and in August, 1904, a concerted attack was delivered on the Herero forces concentrated in the Waterberg region. The natives were dispersed, and the struggle entered the guerilla stage. In October, however, the Hottentot tribes of the south, joined by Herero fugitives, declared war against the government, and for a year, under their chiefs Moronga, Witboi, Hendricks, and Morris, more than held their own against the Germans, who were hampered by the extremely difficult nature of the country and the lack of water and transportation facilities. The war lasted through 1905 and into 1906. Up to March of that year the cost of the war to Germany was more than \$50,000,000 and nearly 2000 men dead and wounded, while 14,500 troops were still engaged in the colony. The sanguinary nature of the contest appears from the report that of the Herero nation, estimated at 100,000 before the war, only 11,000 surrendered. Of the rest some fled to British territory, but the greater part had succumbed in the war or perished in the Kalahari Desert. In 1907 the war broke out again, when

Morenga escaped from British territory, where he was looked upon as a political refugee. He was hunted down and finally killed. This was probably the greatest step towards the complete subjugation of the colony. In 1908 diamonds were discovered, and immediately a large crowd of adventurers rushed in. In 1909 over \$5,000,000 worth of diamonds were shipped to Germany. In 1911-12 France and Germany nearly went to war over the latter's African possessions, and war was only averted by the former's concessions. Germany must now take an equal rank with both France and England as an African power. For an account of the military operations consequent upon the outbreak of the European war of 1914 see WAR IN EUROPE.

Consult Von Bulow, *Deutsch-Sudwestafrika* (Berlin, 1896), Watermeyer, *Deutsch-Sudwestafrika* (ib., 1899), Hermann, *Viehzucht und Bodenkultur in Sudwestafrika* (ib., 1900), Schwabe, *Im deutschen Diamantenlande* (ib., 1909), Dove, *Sudwestafrika* (ib., 1913).

GERMAN THEOLOGY. As the theology of the original home and chief seat of Protestantism, and as a doctrinal system which has experienced great vicissitudes, German theology has a peculiar interest and value to the historical student.

I The Foundation. The fundamental element of the Reformation was the spiritual change of regeneration, out of which sprang the conception of justification. This was "by faith" because it had come in the midst of an experience of real and living contact with God. The Nicene foundation was retained because it accorded with the experience of the saving work of Jesus Christ. The Augustinian anthropology was retained because it explained the sense of helplessness in sin. The preaching of Luther may be summed up as a preaching of Christ as a living Redeemer by one who claimed a personal experience of what he preached. Melancthon began the process of teaching and formulating the new theology at an early date (1520). By the year 1530 a mature and well-balanced sketch of the reformed doctrine was prepared for presentation to the Diet of Augsburg. This "Confession" explicitly rejects those features of the Catholic system which Protestantism (q.v.) united in regarding as errors and briefly gives assent to the common doctrines of all Christian churches. It is distinguished by the following doctrines: justification by faith, obedience to God's law, not required as a condition of "meriting justification," but springing out of faith; the Church, "the congregation of saints and true believers", two sacraments, prevenient grace, the guilt and personal origination of sin. The personal attitude of Luther towards the Scriptures was quite free. The canonicity of any book was determined by its relation to Christ. The authority of the Scriptures he rested upon the testimony of the Spirit. His views of the bondage of the will were extreme, and his doctrine of predestination absolute. By the time when the Formula of Concord was written (1576), predestination was identified with election to life alone. Thus the tendency of this theology was from life to doctrine.

II. The Period of Formal Orthodoxy. When the main doctrine of the new system had been determined, the attention of theologians was naturally directed from the search after new truths to the formulation, adjustment, and defense of the truths already gained. This was

the more necessary because of the foundation of the Order of Jesuits especially established to counteract Protestantism, among the first members of which were accomplished theologians and disputants, such as Bellarmine. Hence there arose a series of great constructive Lutheran theologians, of whom the principal were Calixtus, Calov, Johann Gerhard, Baier, Chemnitz, Hunnius, Hutten, Quenstedt. The early portion of this period was also distinguished by the production of great hymns and by very effective evangelical preaching. But as interest concentrated upon doctrine, the religious life began to wane. The system also underwent serious modifications. The doctrine of justification by faith lost its place as the controlling element in the system. The change may be seen in the modification of the doctrine of the Scriptures. The freedom of Luther disappears, the testimony of the Spirit is undervalued, theories of divine dictation arise, and finally the authority of the Church is sometimes declared to be enough to maintain the canonicity of a book. The immense havoc wrought by the Thirty Years' War completed the demoralization of both religion and theology.

III. The Period of Pietism. Some theologians had protested against the scholastic tendency of theology, but without effect. It was arrested by a remarkable revival of practical religion, which spread over Germany. This commenced through the instrumentality of Johann Arndt, who published (Magdeburg, 1610), in 4 volumes, *True Christianity*—a book intended to arouse persons of all classes, but especially ministers and students, to practical and heartfelt religion as well as to purify the corrupt morals of the age. It produced a powerful impression. The movement thus commenced was greatly advanced by Spener (1635-1705). He established religious meetings, called "colleges of piety." This name led to the movement being called pietism. It spread rapidly through Germany and at first without excitement or opposition. But as the effect increased, popular agitation was awakened, and violent tumults arose which, beginning in Leipzig, extended through the Lutheran churches in the different states of Europe. From this time, in all cities, towns, and villages where Lutheranism was established, there appeared suddenly persons, of various ranks and of both sexes, who declared that it was their mission to uproot iniquity, spread true religion through the world, and impart to the Church of Christ wiser rules than those which then prevailed, but without introducing any change in the doctrine, discipline, or government of the Lutheran church. The University of Halle, founded 1694, became the home and centre of pietism. The orphan house, established in that city by Francke, was one of its most efficient instrumentalities, because a living proof that it was able, not only to resist religious error, but also to supply the gravest wants of life. During the 30 years after the university was founded, it educated 6000 theologians. Its Oriental college prosecuted diligently the study of the biblical languages and sent out missions to Mohammedans and Jews. From Halle the new life was diffused over Europe. The larger cities showed signs of reviving faith, and even the universities, which at first had violently opposed the movement, became its friends. Pietism was extended into Wurttemberg and the University of Tubingen by the labors of Bengel,

the critic, exegete, and theologian of the movement, and into Moravia by those of Zinzendorf, Zurich, Basel, Bern, and many other large towns admitted it. It went as far east as the Baltic and as far north as Norway and Sweden. Many of the continental courts were influenced by it. The Reformed church was awakened, England and the Netherlands received the new movement with joy.

The movement did not fail to stir up prolonged controversy between the pietists and the theologians. Among the results of this are to be numbered the historical labors to which the mediating school turned its attention, in which Mosheim bore a leading part. Modifications of orthodoxy were also made in the direction of curtailment, the guilt of original sin was made to depend upon consent to Adam's sin, inspiration was weakened, justification was confounded with sanctification, the Trinity, incarnation, and atonement were regarded as mysteries which it was useless to attempt to comprehend. The experimental proof of Christianity was more and more abandoned, and an external, philosophic proof substituted in its place. The school of Wolf sought to demonstrate Christianity mathematically. The idea of God was derived from the light of nature, the holiness of God in the presence of guilt proved the necessity of the revelation of an atonement, if atonement is possible and capable of being known. Now it is possible, and its predicates constitute the criteria of a revelation, to which criteria the Scriptures correspond. The proof of the Scriptures was later still more externalized. The argument began from the authenticity, genuineness, and historical credibility, then were inferred the sinlessness and miracles of Christ, which are to be credited, then His promise to the disciples of inspiration, and then the authority of the inspired Scriptures. This is an essential change from the method of the Reformation.

IV *The Inroad of Rationalism.* 1 *Its Incipient Advance*—In the next generation the fervor of pietism had abated. The diligent study of scriptural truth was exchanged for passive assent to it. Spener had endeavored to unite reason and faith, but his followers, renouncing reason, clung to faith alone. In this way pietism unintentionally, but really, exerted an influence against the orthodox system of doctrines by attaching great importance to the Bible alone as opposed to creeds, and to the witness of the Spirit as opposed to the written word. Zeidler, an eminent minister at Leipzig, honoring the Bible, treated systems of doctrine with contempt. Some fervent mystics, in their zeal for the "inner word," spoke lightly of inspiration and atonement. Some insisted simply on Christian love and morality, heedless of danger from the assaults of false teachers. Koch (1754) lamented the low esteem into which the Bible had fallen among all classes of society. This pressure against orthodox doctrine at home was strengthened by influences coming from England and Holland, the force of which may be estimated by the opposition at first made to it as indicated by the fact that, within 40 years, nearly 90 works were published against various phases of unbelief. 2 *The Period of Historical Criticism*—At the middle of the eighteenth century German theology was in a rigid and shallow condition. The contest between pietism and formal orthodoxy had ceased

The second generation of professors at Halle had gone. The old defenders of orthodoxy had disappeared. Then the era of historical criticism was ushered in. New investigations were begun, antiquity, literature, science, were diligently explored, the circle of religious beliefs was thrown open for reexamination. On this field also English deists had already been at work. In Germany, Semler of Halle led the advance, obscuring the old orthodox landmarks, questioning the accuracy of the biblical text, disputing the genuineness of many biblical books, and undermining usages and doctrines which hitherto all had received. The vigor of critical examination thus awakened spread rapidly among the universities and the clergy. It was employed on biblical criticism and exegesis, Church history, and the history of doctrine. To the authority of the Church Semler, indeed, held fast, affirming that the symbols and forms are useful in preserving external unity and uniformity. He asserted that Christ and the Apostles taught many things in mere accommodation to the prejudices of the age. The doctrines of the Bible Semler vigorously attacked. What he did at Halle, other men did in different parts of Germany. It became manifest that criticism, if left to itself, would produce only destruction. This compelled the search for something that would avert the fall. At the opening of the nineteenth century the Scriptures, rationally interpreted, were still regarded as teaching a rational religion. But as the historical exegesis had advanced, the chasm had widened between the traditional and the rational sense. The accommodation theory was increasingly applied to every portion of the Bible, and at length the mythical theory began to appear. Baur, in 1824, published a Hebrew mythology of the Old and New Testaments, in which the miracles were explained away as merely natural events. 3 *The Connection of Rationalism with Philosophy*—The work of preparation for rationalism had at first been prompted by the demands of what was called "the sound human understanding," but after the opening of the eighteenth century the aid of philosophy also was sought. Wolff proposed a division of theology into natural and revealed, and as natural theology could give the reason for the facts which it affirmed, and revealed could not, emphasis was put chiefly on the former. After the decline of Wolff's popularity the criticism of Semler and his followers seemed harmonious enough with the eclectic system which for a time prevailed, for both the criticism and the philosophy were in accordance with the demands of "the sound human understanding." But Kant's philosophy assailed both. Some of the rationalists, indeed, claimed it as favorable to them, others slighted it as unintelligible, but a few more discerning men saw that the new would overturn the old. When the speculative systems of Fichte and Schelling appeared, they despised the reasonings of "the sound human understanding" and slighted the best principles of rationalism as commonplace and vulgar. And rationalism, on its part, shrinking back from the new atheism, wrote strongly against it. In the faith philosophy of Jacobi the rationalists thought they could find refuge. Their scheme hitherto had allowed no scope to sentiment and the heart. A mere probability was its highest word for the essential truths. The system of Jacobi met this dif-

ficulty, since to the intellectual probability it added the certainty of feeling. Therefore the better class of rationalists welcomed it. With this rose also the supernaturalist school, including those who denied the absolute rule of reason in matters of religion, and, though many of them were deficient in reverence for the Bible, they were at least travelers in an upward path. Hegel and his followers professed to present the pure and final rendering of that which Christianity gives in a popular form—to vindicate philosophically the Trinity, the atonement, and the other doctrines of the orthodox creed, and to refute the rationalism which had impugned these mysteries. This claim Strauss, in his life of Jesus, utterly denied. Treating the Gospels as a narrative of merely natural events, he asserted that Jesus was a devout man, whose rebukes of hypocrisy led to his death. The wonderful works of beneficence and power with which the narrative was adorned were only fanciful inventions of His disciples, which ultimately came to be regarded as facts. This historical Jesus Strauss strove to transform into an ideal character, and affirmed that the God man is to be looked for not in any one person, but in the human race as a whole.

V **Return to Evangelical Doctrine** As the way for the prevalence of rationalism had been opened through the decline of practical religion, so the return to evangelical doctrine was effected by a revival of personal piety. While Semler was subjecting the Bible to rationalistic criticism Klopstock wrote and published his *Messiah*, which was spread over every part of Germany and among all classes, awakening admiration and kindling devotion. About the same time Hamann, a young German, after vainly seeking relief in folly and vice from the effects of disappointment, retired to a remote part of London, obtained a Bible, and read it carefully. With a revulsion of feeling he entered at once on a new course. His writings and genius soon procured him friends in his own country and gave him influence over the noble, the gifted, and the rich, by which they, as well as men of humbler life, were won to the Christian faith. Herder, contemporary with both Klopstock and Hamann, in his *Spirit of Hebrew Poetry*, gave attention particularly to the literary and human elements of the Bible as, in his opinion, strengthening its claims to a divine origin. He pointed out critically its poetical beauties, not as if they were ornaments only, but as springing from the heart of the revelation and forming an essential accompaniment of inspiration. While imparting elevated views of the Scriptures, he labored also to exalt the pastor, considering that his true place was by the side of the old prophets, and that no man was worthy of the office who neglected the particular care of souls. He was himself, in many respects, a model preacher. While the three distinguished men above mentioned were in the midst of their active work, Schleiermacher was born, who has been called the greatest divine of the nineteenth century, and to whose influence for good scarcely any limit can be assigned. In his fifteenth year he was sent to a Moravian school, whence he brought a personal devotion to Christ. His *Discourses to Unbelievers of Cultivated Minds* (1799) marked at once the opening of a new century and of a new era in religion. In 1789 David Mendel was born of poor Jewish parents—his father a peddler, his mother an

intelligent and pious woman. At Hamburg he was assisted in acquiring an education and soon won the respect of teachers and scholars by his talents, while he excited also then admiration by the oddity of his appearance and the awkwardness of his manner. When Schleiermacher's *Discourses* were published, Mendel was one of the multitudes awakened by them, and in 1806, renouncing Judaism, he was baptized and took the name Neander (a new man). He studied theology at Halle, where Schleiermacher was his favorite professor and deeply interested friend. In 1812 both teacher and pupil were made professors in the new university at Berlin—the former of theology, the latter of Church history. In this position Neander worked to the end of his life and acquired, as a lecturer, vast renown. Even Schleiermacher's hearers were limited in number when compared with the crowds that came from all parts of Germany and the most distant Protestant countries to hear Neander. Many Roman Catholics also were found in his classes. All the great preachers of Germany became more or less enlightened by his ideas. His salutary influence on the religious condition of the country was immeasurably great, powerfully contributing to the overthrow both of rationalism and of dead formalism and drawing multitudes of young men to embrace the vital doctrines of Christianity. With him religion was nothing without Christ—not only apprehended by the intellect, but also loved and trusted with all the powers of the soul. In his view sin was not only injurious, but also involved guilt, and could be pardoned only through the death and mediation of Christ. In 1816 Tholuck entered the University of Berlin, where he was rescued from skepticism under the instructions of Schleiermacher and Neander, aided by the influence of a distinguished Moravian friend. In 1826 he became professor of theology at Halle as the successor of Professor Knapp, who had sincerely but timidly resisted the prevalent rationalism. Out of 900 students only five avowed their belief in the divinity of Christ, and all the professors, being rationalists, opposed Tholuck's appointment. But the number of young believers in Christ increased year by year. Many thousands of young men became Christians under his instructions. Hengstenberg (1802-69) devoted his youth chiefly to the study of philosophy and the Oriental languages, but, during a season of sickness and sorrow, having turned with great ardor to the spiritual teaching of the Bible, he became fully convinced of the divine authority of evangelical religion and of the excellence with which its truths are expressed in the Augsburg Confession. In 1826 he was made one of the professors of theology at Berlin, and from that time, for more than 40 years, was a conspicuous and earnest defender of Christian doctrine, as based on the divine authority of the Scriptures. Among his numerous writings may be mentioned, as having special influence *Egypt and the Books of Moses*, *Commentary on the Psalms*, and *The Christology of the Old Testament*.

VI **The Last Half of the Nineteenth Century** Four general schools of thought may be distinguished. The first, proceeding from the school of Schleiermacher and adhering to the "union" (of the Reformed and Lutheran churches in Prussia), may be called an evangelical, conservative school, though in such

representatives as Dorner and Rothe exhibiting a large degree of speculative independence. Dorner founded his system upon speculation rather than upon exegesis. Julius Müller was the next important member of this school. The second school, the confessional school, was still more conservative, rallying around the historic confessions of the Lutheran church. It rose in the circles in which the Lutheran protest against the "union" was most vigorously made. Its chief seat became the University of Erlangen, where a series of able men defended it—Haeussler, Thomasius, Hoffmann, Frank, and Zahn. For a long time it was powerfully represented at Leipzig by Luthardt, Kahnis, Delitzsch, and their colleagues. Thomasius, formed by Schleiermacher and influenced by Hegel, embraced the old Lutheran orthodoxy with great warmth and sincerity. He sought to develop its Christology by the suggestion of the "kenosis" (qv). Hoffmann was the great exegete of the school. Frank had more of the spirit of Luther than the others and based his theology upon Christian experience, conceived as having its ultimate element in the new birth. Luthardt did not sympathize with these modifications. Delitzsch, with others, formed the "New Lutheran" party, which laid great emphasis on the doctrine of the Church. The third school takes its rise from Baur and has adhered in various degrees to the principles of Baur's historical criticism (Hilgenfeld) or has gone over to a substantial naturalism (Pfleiderer). It is most remarkable that, while the second school has still a large following among the pastors throughout Germany, in academic circles the three all lost their leadership and were almost everywhere replaced by the members of the fourth school, that of Ritschl (qv). From about 1870 to about 1900 the Ritschlian school was constantly upon the increase. Ritschl, having for a time been an adherent of Baur, finally came to occupy a position of his own, which may be summarily described as an effort to derive theology from the principle of the divine love, with such an emphasis upon the Christian life that elements of the doctrinal system not having evident connection with this should be excluded. Purely speculative theology was regarded as belonging to philosophy, not to religion. The essence of religion is a practical faith, issuing in ethical and social life. Ritschl succeeded at Göttingen by Schultz, his colleague, and the school is represented at many places—at Bonn, Bender and his son Otto Ritschl, at Strassburg, H. H. Wendt, at Marburg, W. Herrmann, at Basel, Duhm. At Leipzig, Gregory, who has continued Tischendorf's work, is a Ritschlian. But the centre of the influence of the school is now Berlin, where Kaftan represents the right wing, approaching very close to evangelical standards in his *Dogmatik*, and repairing most of the defects and omissions of Ritschl; and Harnack the left wing, whose monumental historical work has given him the acknowledged first place in his department in the world. As defined by one of their own number, "the Ritschlian school is not a school, and embraces men of quite widely different styles of thinking, being united only in this, that it demands that a man shall love truth and seek that alone without fettering prejudices. All such it welcomes."

During the last decade a new school, the *Religionsgeschichtliche*, history of religion, has arisen in Germany, largely from the Ritschlian

school. It does not abandon the essential Ritschlian positions, but designs to supplement them. The school aims to remove Christianity from the isolation in which previous theological study has kept it and to interpret it in the light of the religions which influenced its origin. It wishes to make religion a power in life and to this end has popularized the results of scholarship in series of small books, *Popular Tracts of the History of Religion* and *The Problems of Life*, and in popular journals. It agrees with the Ritschlian school in basing religion on experience rather than upon theology or Church authority. While most of the work of the school has been historical, Troeltsch is its representative in systematic theology. Its task will be to work out what Ritschlianism did not have, a philosophy of religion. Meantime the extreme rationalism of earlier years is represented by the Monist League, which attempts to popularize the ideas of Haeckel, and the extreme conservatism by a revived conservative movement which does not ignore the results of modern scientific study, but still holds to an objective revelation issuing in dogma.

Consult Doane, *History of Protestant Theology* (trans. Edinburgh, 1871), which covers the whole field, Landerer, *Neueste Dogmengeschichte* (Altenburg, 1881), beginning with Semler, Frank, *Geschichte und Kritik der neueren Theologie* (Leipzig, 1898), beginning with Schleiermacher, Lichtenberger, "History of German Theology," in the *Nineteenth Century* (New York, 1889). Nippold and Pfeiderer have published valuable sketches of the theological history of the nineteenth century.

GERMAN TINDER. See AMADOU.

GERMANTOWN. A former suburb of Philadelphia, since 1854 included within the municipal limits and now forming the twenty-second ward (Map Philadelphia and vicinity, D 3). It is about 5 miles to the north of the centre of the city. Its picturesque site, the superior character of its architecture, its beautiful gardens, and the large public libraries render it a charming place of residence. To the west is the romantic gorge of the Wissahickon, to the north is Chestnut Hill, with its fine villas. There is a large section occupied by manufacturing establishments. Germantown was settled in October, 1683, by a party of Germans, four of whom in 1688 made the first formal protest ever made in America against slaveholding. The first paper mill in America was erected here in 1690, and here also, in 1743, the first American edition of the Bible in any language was printed. Germantown is chiefly notable in history for the battle which was fought here on Oct. 4, 1777, between the Americans under Washington and the British and Hessians under Howe. Washington opened the engagement at daybreak on the 4th. At first his centre and left, under Sullivan and Greene respectively, forced back the opposing British and Hessians, and victory for a time seemed assured, but Stephen, on Greene's right, through a dense fog, mistook the American left centre under Wayne for the enemy and opened fire, while a body of English, who had taken refuge in a large stone house, the residence of Judge Chew, in the rear, detained a part of the American forces. Stephen's accident, coupled with the continual firing in the rear, threw the American troops into confusion, but Washington led them from the field in perfect order. The British

loss was 575, the American, 673 Washington's apparent audacity in attacking Howe so soon after the battle of Brandywine (qv) greatly encouraged the army and the people and, together with Gates's success at Saratoga, led the hitherto wavering French court to form an alliance with the United States Consult Scharf and Westcott, *History of Philadelphia* (Philadelphia, 1884), Carrington, *Battles of the American Revolution* (New York, 1878), Lossing, *Field Book of the Revolution* (ib, 1859), Pennypacker, *Settlement of Germantown* (Philadelphia, 1899), Jellett, *Germantown Old and New* (Germantown, 1905), Jenkins, *Washington in Germantown* (ib, 1905), Keyser, *History of Old Germantown* (ib, 1907), Sachse, *Quant Old Germantown* (Philadelphia, 1913) For a further description of Germantown, see PHILADELPHIA

GERMANUS, or GERMAIN, SAINT (c 378-448) Bishop of Auxerre He was born in Auxerre, 100 miles south of Paris, of an eminent family, and became learned in literature and law and distinguished for eloquence He was military governor of his native district, afterward Bishop of Auxerre. On being chosen Bishop (418) he separated from his wife, built a monastery, devoted his spare property to the poor, and thereafter lived a life of the severest asceticism He visited England twice (430 and 447) for the purpose of combating Pelagianism, and on the first occasion, shortly after Easter, 430, led the Britons against a plundering party of Picts and Scots, terrifying them into a retreat by shouting "Alleluia," from which circumstance the event was called the "Alleluia victory." It was he who discovered the future patron saint of Paris, Genevieve (qv.) His life as told is romantic and in part miraculous He died at Ravenna, Italy, July 31, 448 His feast occurs on July 31 The Life attributed to Constantius, but which may be by a later writer, was put in verse by Heiricus, or Herecus, of Auxerre, and used by Bede (qv) in vol i of his History. Consult Baring-Gould, *Lives of the Saints*, vol i (London, 1874); Stephen Langdon, "Life of St German," in No 9 of the *Lives of the English Saints* (ib, 1844), also, for his connection with St. Patrick, Barry, *Life of St Patrick* (ib, 1905)

GERMAN VERSION. See BIBLE

GERMANY. An empire which takes in the central part of Europe The main highways between the north and south and the east and west of Europe pass through it It is in closer touch with most of the leading nations of Europe than any other country, for it is bordered by Russia, Austria-Hungary, Switzerland, France, Belgium, the Netherlands, and Denmark, and is within a day's sail, across the North Sea, of Great Britain Besides the land boundaries formed by the seven countries above mentioned, it has a sea frontage of 1200 miles on the North and Baltic seas—one-third of the entire frontier The country extends east and west through 17° of longitude, or 750 miles, north and south through nearly 9° of latitude, 47° to 56° N, or about 600 miles. Its area is 208,825 square miles, exclusive of the German portion of Lake Constance (70 square miles) The German Empire embraces the territory of the German Confederation of 1815-66, with the exception of the Austrian portions thereof (in a great part of which the German language predominates), as well as of Luxemburg and Liech-

tenstein, but with the addition of the Prussian provinces of East Prussia, West Prussia, Posen (not included in the old German Empire), and Schleswig, and Alsace-Lorraine Capital, Berlin.

Topography. The southern two-thirds of Germany is highland, the northern third is lowland, a part of the low plain of Europe Three topographic forms predominate in central Europe The most southerly is the high Alps of Switzerland North of the high Alps are the Mittelgebirge (secondary mountains), or highlands of Germany North of the highlands is the German low plain The highlands consist in part of high plains, rolling or hilly areas, and in part of short mountain chains or groups of mountains, which extend from southwest to northeast or from southeast to northwest, seldom from south to north Only a few summits among these mountains exceed 3500 feet in height The mountain systems inclose high plains, as, e.g., the plains of Bavaria and of the middle Rhine basin This division of south Germany by natural barriers was a powerful influence in separating the German people into many different states, each having its own government

The most northerly system of these mountain chains has a general east and west direction, roughly at right angles with the mountains directly to the south It extends through the middle of Germany and forms the boundary between north and south Germany, or, in other words, between the highlands and the low plain This zigzag boundary wall begins in the east with the Sudetic Mountains (including the Giant Mountains, or Riesengebirge) and is extended farther west by the Erzgebirge, the Fichtelgebirge, and the Thuringian Forest The valley of the Elbe is the only break in these 390 miles of boundary mountains Then comes the wide gap formed by the Hessian upland, broken only by the volcanic uplifts of the Rhon Mountains and the Vogelsberg Through this break in the barrier mountains flows the Weser to the north In the west the boundary wall rises again in the Taunus, around which is one of the finest wine regions of Germany and, across the Rhine valley, in the Hunsrück Outlying elevations to the north of this wall in the middle Weser and Rhine basins push the highlands a little farther north in that region, and the low plain in front of them is correspondingly contracted The culminating feature of these outliers is the Harz Mountains. The more southerly of the highlands mountains comprise among other chains or ridges the Schwarzwald, or Black Forest, the Swabian and Franconian Jura, and the Bavarian Forest. The Alps enter in the extreme south A dominant mountain mass west of the Rhine is constituted by the Vosges Physiographically interesting is the volcanic region, north of the Moselle, known as the Eifel The highest point of land in the Empire is the Zugspitze, in Bavaria, 9725 feet in elevation

In sharp contrast with the broken and divided character of the lands of south Germany is the nearly uniform low plain of the north, which merges on one side without any distinct natural boundary into the plain of Russia, and on the other into the lowlands of the Netherlands As the course of the chief rivers shows, the whole country slopes gradually north to the Baltic and northwest to the North Sea.

On the sea frontage there are many inlets,

but few good harbors. The shore waters are quite shallow, and large vessels are usually unable to approach the land except where the rivers have worn a channel. Most of the harbors therefore are at the mouths of rivers or some distance inland on their banks. Wherever the sand dunes along the low North Sea do not prevent the sea from breaking in, dikes have to be built for the protection of the coast. The shores of the Baltic are higher, but the commercial facilities they afford are much impaired by a series of very shallow lagoons, called *Haffs*, which have been formed by sand spits and barrier beaches. The islands are not important. Rugen, in the Baltic, is the largest. The Baltic shore is outbuilding and is bordered by an almost continuous line of sand dunes, but the North Sea line is receding, the Frisian Islands with their dunes representing the former coast line. The most important North Sea ports are Hamburg, on the Elbe, and Bremen, on the Weser, together with the subsidiary ports of Bremerhaven and Geestemünde. The principal Baltic ports are Stettin, Danzig, Kiel, and Lübeck.

Hydrography. With the exception of the southeastern part of Germany, through which the Danube flows to the east, all the rivers belong to the Baltic and the North Sea basins. The Rhine is the only river which binds together the three great topographic forms—the high Alps, the German highlands, and the low plain. It belongs to three countries—Switzerland, Germany, and the Netherlands. Commercially it is the most important river in Germany, small river steamers being able to ascend to Basel, and small seagoing steamers to Mannheim. The Weser and the Elbe, the latter rising in Austria, bind together the German highlands and low plain. The Elbe is second only to the Rhine in commercial importance, being navigable throughout the whole of its course in Germany. Along its course are some of the most important silver and coal mines, salt fields, sheep pastures, and beetroot areas in the Empire. Besides being the greatest water commerce carrier through central Germany from the south border to the North Sea, it links Berlin, the capital and business centre, with Hamburg, the chief port, by the canals of the Havel and Spree river systems. The Weser is also of great importance in its lower course. The Oder and the Vistula are the chief Baltic rivers. Both rise in Austria, have only a short course in the highlands, and flow mainly through the lowland. The Oder is the great waterway of the rich mining and manufacturing district of Silesia, and of the wide farming area around Frankfurt-on-the-Oder, with the canal leading to the Spree it is a highway for Berlin's commerce from southeast Prussia to the port of Stettin. The lower part of the Vistula is German, but it carries a great deal of Russian timber, grain, and fibres to Danzig for export. Among other important streams are the Ems, flowing into the North Sea, the Main and the Moselle, affluents of the Rhine, the Pregel and Memel, flowing into the Baltic, and the Saale, an affluent of the Elbe. The rivers of Germany are naturally navigable for nearly 6000 miles, are canalized for nearly 1400 miles and there are nearly 1500 miles of canals. Among the most important of the canals are the Ludwigskanal in Bavaria, uniting the Danube with the Main, and thus supplying a continuous waterway from the North to the

Black Sea, the system connecting the Memel with the Pregel, that joining the Oder with the Elbe, the Plauen Canal, connecting the Elbe with the Havel, the Eider Canal, connecting the Eider with Kiel, the Rhine-Rhone, and the Rhine-Marne, in Alsace-Lorraine, the Dortmund-Ems Canal, connecting the Rhine with German ports and when completed with the other canals making a waterway system from east to west across the German lowland, the great Baltic Sea or Kaiser Wilhelm Canal, begun in 1887 and opened for traffic in 1895, saving two days' time by steamer between Hamburg and all the Baltic ports of Germany, and several canals in process of construction, notably the Rhine-Weser Canal, which is to cost over \$60,000,000. See CANAL.

The lakes of Germany are chiefly in two groups, of which the smaller is in the southern section, in the Alpine Foreland. These lakes are found only in regions once covered by glacier ice, being rock basins, and their existence is closely connected with the scouring action of the ice sheet that descended from the Alps during the great Ice age. The larger group extends over the northern lowland, with the greatest number of lakes east of the Elbe, and most of these were formed by the dumping of till across the valleys of streams during the retreat of the continental ice sheet.

Climate. The temperature differences between the north and the south are not so great as might be expected, because the elevation of the south, much higher than that of the north, counteracts the effect of the difference in latitude. The differences are greater between the west and the east. The Rhine lands are the warmest, and the Baltic Sea lands the coldest, parts of Germany. The business of the Baltic ports is much impeded by ice in winter, while the North Sea ports are less affected by this impediment, though not quite free from it. A line drawn from Bremen to Munich divides Germany into two sections climatologically. On the west the climate is much like that of France, and mild winters and not excessively hot summers are the rule, but on the east the temperature assumes rapidly a more continental character, tempered by the close proximity to the sea at the north, but rigorous in the interior. The rainfall, owing to the nearness of the sea, is usually sufficient for all forms of agriculture. The Harz Mountains, far enough north to catch the wet winds from the North Sea, have the heaviest rainfall. The annual rainfall is from 25 to 30 inches for most of north Germany, but in the extreme south and west it exceeds 30 inches. In the neighborhood of some of the mountain ranges there are local increases of precipitation to 40 inches and upward.

Flora. In early days Germany was full of swamps and largely covered with forests. Most of the swamps have now been turned into fields and pastures, but a fourth of the Empire is still covered with forests which are cared for as assiduously as any field crop. A third of the forests are in leaf trees, the beech being most prominent. Two-thirds are in coniferous trees, particularly pines and firs. As the temperature decreases from west to east, the leaf trees predominate in the west excepting in the sandy low plain, and the coniferæ in the east. The crowning glory of the German flora is these woodlands.

Germany has in the north the Baltic flora and

in the south the Alpine. The two mingle in the interior. The elevation of the land also has a strong influence on the local flora, so that the Alpine flora extends far to the north on the mountain tops, and the Baltic flora penetrates to the south in the valleys. Moreover, on the east the steppe flora penetrates from Russia, and on the west the west European flora penetrates from France. Upward of 2200 flowering plants, 60 cryptogams, and 750 mosses are found in German territory. In the south and west the vine grows luxuriantly, and grasses flourish in the lowlands.

The best farming lands are in the warm, well-sheltered Rhine valley, with its rich alluvial soil, where the vine is brought to an unusual degree of perfection. Many of the hill slopes throughout the highland are terraced and cultivated, but the mountains are forest-clad, and cultivation is chiefly confined to the plains and valleys. The soils differ in natural fertility, but are better than those of the low plain of the north. The soil of most of the low plain is poor and sandy, particularly in the centre and east, and is kept in a state of high productivity only by scientific tillage and fertilization.

Fauna. Germany, because of its situation, exposed to cold airs of the north and cut off from the south by lofty mountains, has a decidedly northern fauna, and the fastnesses of the Harz and the mountains of Bavaria, Saxony, and Silesia have preserved several wild forms extinct or nearly so elsewhere in Europe. Thus there may still be found there bears, wolves (occasionally, along the Russian border), foxes, martens, weasels, badgers, otters, wildcats, and lynxes. Fallow deer are known only in a few parks, but the roe and wild boar are obtainable in many forests, and the elk still exists along the Polish border. All these, together with the Alpine chamois, are "preserved." The birds are those of Europe, with the absence of several semitropical species common south of the Alps. Most of them are migratory and traverse the Empire along two great "highways." One leads to and from Africa along the Rhine-Rhone valley and thence east in spring and west in winter along the Baltic shore to and from north Russia, the other follows the Danube valley to and from Asia Minor and India. Of the resident birds the most remarkable is the great capercaillie of the eastern districts. Reptiles are not as well represented in Germany as in warmer and more diversified France and Italy, and the adder is nowhere common. One of its frogs, called the "fire-bellied," is well known. Germany shares in the fish and fisheries of the North Sea and possesses the larger part of the south shore of the Baltic. This inland sea seems some thousands of years ago to have admitted the ocean more freely, and then, as is shown by prehistoric shell heaps, marine fishes, oysters, and edible mollusks generally abounded in its waters. Now there are few sea fisheries of consequence in any part of the Baltic, which seems to be growing steadily shallower and fresher, with consequent alteration of its biological character. The rivers of Germany abound in fishes of large variety, among which the salmon and trout that ascend the larger streams from the Baltic are prominent. The Danube forms a province of the Black Sea faunal district where no salmon are found. The carp family is largely represented, and the catfishes (*Siluridæ*) of Germany are especially big, numerous, and

edible. Insects are numerous, and bees are raised in some provinces to an extent hardly equaled elsewhere in Europe.

Geology. The surface geological formations of the northern plain are mainly Quaternary sands and clays of alluvial glacial deposit, with an occasional patch of firm Tertiary formation emerging from it. The great central highland is represented by all the formations, but is chiefly Mesozoic. On the south border of the Quaternary plain where the highlands begin, there are in the region of the Weser highland narrow transition bands of the Cretaceous and Jurassic formations, which are replaced a little farther south by the great central area of Triassic rocks. On the west of the Weser highland the Quaternary formation of the north is replaced on the south by a broader Cretaceous zone, somewhat interrupted by the Quaternary, and south of the Lippe in the region of the Ruhr is a narrow belt of Dyassic and coal formation which in the Sauerland highlands is replaced by the extensive Devonian and Silurian areas of the middle Rhine, and which extends far to the westward into France. These formations are interrupted by patches of eruptive rocks and Tertiary formations and are bordered on the southeast directly on the Rhine by Tertiary formations, which, however, are soon replaced by the Quaternary, which characterizes the upper middle Rhine valley, and which interrupts the great Triassic area of central and south Germany. West of the Rhine the Quaternary formations of the northern plain extend somewhat farther south than east of the Rhine, and are bordered on the south by the Jurassic of the Jura Mountains. In the region of the Black Forest on the east end of the Vosges Mountains on the west of the Rhine valley are extensive areas of old crystalline rocks. In the Harz Mountains the central area of Devonian and Silurian formations is surrounded by a narrow strip of Dyassic formation, which on the south is replaced by the Triassic, until interrupted in the Thuringian Forest by recurring Dyassic, Devonian, and Silurian formations. The great central Triassic area is bordered on the south by the long Jurassic chain consisting of the Swiss, Swabian, and Franconian Juras, which extend on the north side of the Rhone, the Aar, and the Danube from the Rhone to the Main. Parallel to this chain and south of the Aar and the Danube is the extended Tertiary area of the Alpine Foreland and the Chalk Alps, which is separated from the central Alpine region of old crystalline rocks (Archean) by a narrow border of Jurassic formation. Germany has been glacier-covered as far south as lat 51° 30' in the western and 50° 30' in the eastern part.

Mining. The mining interests are of great importance, the mines and smelting works combined having given employment to nearly 1,000,000 persons in 1912. Germany is the third largest coal and second largest iron producing country in the world, the United States leading in both, and Great Britain being second in coal production. The export coal trade is steadily increasing. The total yield of the mines, exclusive of lignite, for 1905, was 121,298,167 tons, and in 1911 160,747,580 tons. The lignite production of 1911 was 73,760,867 tons. The value of the coal product in 1911 was \$393,000,000 and of lignite \$45,000,000. Of this amount, nine-tenths were produced in the Prus-

sian provinces of Westphalia, Silesia, and the Rhine, and the remainder in Saxony, Bavaria, and Alsace-Lorraine. About one-sixth was produced in government mines. The steadily growing demand for fuel has greatly increased the mining of brown coal (lignite), in spite of its inferior quality, especially since the device of making it up into briquettes has enhanced its heating qualities and rendered it more convenient for storing and transportation than before. Of the total output of 73,760,867 tons of brown coal in 1911 about four-fifths were produced in the Prussian provinces of Brandenburg, Saxony, and Hesse-Nassau. The following table shows the growth of the coal industry since 1871.

YEAR	Anthracite and bituminous	Lignite
	Metric tons	Metric tons
1871	29,400,000	8,500,000
1881	48,700,000	12,800,000
1891	73,715,700	20,536,600
1901	108,539,000	44,480,000
1905	121,298,000	52,498,507
1911	160,747,580	73,760,867
1913	191,511,000	87,116,000

The annual output of iron has been steadily growing, owing to the constantly increasing demand for raw material from the iron and steel works of Germany. The output of iron ore in 1905 was 16,848,213 tons, and, in 1911, 23,800,000 tons, of which nearly three-fourths was produced in Alsace-Lorraine. The output of pig iron in 1913 was 19,292,000 tons. Germany is rich in other ores, such as copper, zinc, lead, bismuth, nickel, cobalt, etc., the bulk of which is produced in Prussia. The quantity of gold is very small, but the silver mines are perhaps the richest in Europe, yielding about \$8,000,000 worth of silver in 1911. More than one-half of the silver is produced in Prussia. There are large deposits of rock and other salt and an abundance of potash salts, which have contributed greatly to the development of the chemical industry in Germany. Small quantities of petroleum, asphalt, manganese, and sulphur are found. For a more detailed description, see articles on GEOLOGY and MINING.

Fisheries. The German fisheries, while not of very great importance so far as the number of people engaged in them is concerned, have been materially improved in recent years, and the catch of the North Sea and Baltic amounts to about \$4,000,000 per annum. Among the fish of Germany the most generally distributed are carp, salmon, trout, and eels. The rivers contain crayfish, pearl-bearing mussels, and pikes. Cod and herring are taken in the North Sea, and the Baltic fisheries have some value. The exports of fresh fish are insignificant. About \$20,000,000 worth of fresh fish, salted herrings, and other preserved and dried fish are imported annually. The fisheries employ about 35,000 persons, of which number approximately one-half are engaged in the inland waters and the remainder in sea and shore fishing.

Agriculture. Germany is no longer the essentially agricultural country that it was in the middle of the nineteenth century. At that time fully 65 per cent of the people were engaged in agriculture. In 1882 that industry supported 42 per cent of the total population of the Em-

pire, 35 per cent in 1895, and 31 per cent in 1907, as shown by the occupation census of that year. The one-third of the population engaged in agriculture is no longer able to supply the home demand, Germany having become a heavy importer of food products and raw material. Of the total area of 208,830 square miles, about 105,000,000 acres, or approximately 78 per cent, was classed as farm land in the occupation census of 1907. About 60 per cent of the farm land is under cultivation, the remainder devoted to meadows and sown pastures, fruits, and gardens. About 25 per cent of the total area is forest lands, and but about 7 per cent waste lands, streets, etc.

The land is cultivated with great care and intelligence, both in the rich and fertile river valleys of the south and west as well as on the less favored plains of the north and east, and produces every variety of grain and fruit common to a moderate climate. Wheat, rye, barley, and oats are raised in all sections of the country, corn is raised exclusively in the south, while potatoes, as well as peas and beans, thrive best in the north. Flax and hemp succeed best in the middle regions, and this is also true of the oleaginous seeds, rape, poppy, and caraway. Hops, with the exception of those produced in the Prussian Province of Posen, are raised mainly in the south, in Bavaria, Wurttemberg, and Baden, and beetroot is grown in Prussian Saxony, Silesia, and Hanover, as well as in Brunswick and Anhalt. (For further details, see the articles on those countries.) The cultivation of cereals and potatoes is the most important branch of agriculture. The former system of "three-year rotation," in which the land is permitted to lie fallow every third year, has been largely abandoned, and alternation of crops accompanied by plentiful soil foods substituted. This has resulted in an increase of food production in the Empire as a whole. Among the cereals rye predominates, holding the place in Germany that wheat does in the United States. In 1913, 16,035,347 acres were devoted to the culture of rye, as compared with 11,095,338 acres under oats, 8,530,037 acres under potatoes, 4,935,432 acres under wheat, and 4,134,527 acres under barley. The progress of agriculture and the relative importance of the various products are shown in the following table.

CROPS	Tons yield 1880	Tons yield 1905	Tons yield 1913
Rye	4,952,000	9,607,000	12,222,134
Wheat	2,059,000	3,700,000	4,655,156
Barley	2,076,000	2,922,000	3,073,254
Oats	3,700,000	6,547,000	9,713,698
Potatoes	19,400,000	45,042,000	54,121,146
Hay, etc	29,142,000	37,230,000	29,154,194

Thus, while a great part of the agricultural population was diverted to manufacturing and commercial pursuits, the output of cereals was increased during the last 32 years by from 50 to over 100 per cent. Still, Germany is obliged to import increasing quantities of grain, especially wheat and corn, for its own use. Germany produces large quantities of beets, hops, and tobacco, the production of sugar beets having made greater progress there than in any other country, the activity of the government in granting bonuses and otherwise encouraging the industry being accountable for this growth.

From 547,631 acres in 1882, the area under that crop increased to 737,742 acres in 1890, to 1,155,938 acres in 1905, and to 1,369,062 acres in 1913. The principal beet-growing district extends westward from Poland to the region about Brunswick. In 1891 the area under hops was 107,835 acres, in 1900 it decreased to 91,890 acres, and to 67,922 in 1913. The area under tobacco diminished from 59,944 acres in 1880 to 35,452 in 1913. The tobacco crop declined from 52,197 tons in 1880 to 42,372 tons in 1890, to 31,877 tons in 1905, and to 10,671 in 1913. It is raised principally in the region of the Rhine, in the valley of the Neckar, and in the vicinity of Nuremberg. The vine is grown along the Rhine and Moselle, in the valleys of the Main and the Saale, in Lower Silesia and Swabia. In 1912 vines covered 272,265 acres, the value of the wine crop being about \$25,000,000 per annum. The Rhine wines have a world-wide fame. Germany imports, however, double the quantity of wines that it exports.

The great increase in the productivity of German agriculture is due to improvements in methods of cultivation and the increasing use of machinery.

The distribution of agricultural land in Germany is shown by the following statement of the total number of agricultural inclosures (including cultivated lands, meadows, pastures, orchards and vineyards) cultivated by one household on June 12, 1907: number under 2½ acres 2,730,000, between 2½ and 25 acres, 2,300,000, between 25 and 250 acres, 675,000, above 250 acres, 23,000 (these figures being in round terms only), total number of farms, 5,736,082; total acres in farms, 105,000,000. One striking feature of this statement is the large number of very small farms, those under 25 acres forming 87 per cent of the number, while those below 2½ acres were 47 per cent of the total. At the other extreme the farms and estates with an area of more than 250 acres each constitute less than ½ of 1 per cent of the total. The farms with an area of less than five acres each, though constituting much more than one-half of the total number, cover but little more than one-twentieth of the total area. The large landowners possess about one-fourth of all the agricultural lands, leaving about three-fourths of the total area in the hands of the three classes whose farms range from 5 to 250 acres. As a considerable number of the owners of the fourth class are peasants, it may be said that about one-half of the agricultural land of the Empire is in their hands, the land parcels of less than five acres being owned by workmen or people of small means, who use them as garden plots. The large estates are the property of nobles and capitalists.

About 85 per cent of the entire agricultural land is cultivated by the owners, and less than 15 per cent by tenants. About 40 per cent of all the farmers cultivate their own land exclusively, a little over 30 per cent cultivate rented land, in addition to their own, the remaining 30 per cent cultivate rented land exclusively, the proportion of tenants has remained about the same since 1882.

Stock Breeding. The rich meadows on the marshy plains of the north, the grassy mountain slopes and valleys of the central regions and the south, all afford excellent means for the rearing of domestic animals, making the stock-breeding industry important. The scientific cul-

tivation of all kinds of fodder grasses has also contributed greatly to the improvement and increase of German live stock. Sheep raising has been on the decline for several decades, owing to low prices of wool caused by Australian and Argentine competition, but is still important in Saxony, Silesia, and Brandenburg. The best breeds of horses are raised in Mecklenburg, Holstein, Hanover, and West Prussia, the Prussian studs have a high reputation throughout Europe. Cattle are raised chiefly in the rich marshlands along the North Sea, and in the fertile valleys and mountain slopes of Bavaria, Wurttemberg, and Alsace-Lorraine. The following table shows the growth of the stock-breeding industry.

YEAR	Horses	Horned cattle	Sheep	Swine
1882	3,114,420	15,454,372	21,116,957	12,174,288
1895	3,367,298	17,053,642	12,592,870	13,562,642
1904	4,267,403	19,331,568	7,907,173	18,920,606
1912	4,516,297	20,158,738	5,787,148	21,885,073

Forestry. The forest area of Germany is about 34,500,000 acres, the preservation and cultivation of which receive much attention and is scientifically conducted. The local supply of timber, however, does not meet the demands of the home market, and importation is necessary. The larger woods and forests in many of the states belong to the government and are under the care of special boards of management, which exercise the right of supervision and control over all forest land, whether public or private. About one-third of all the forests belongs to the various state governments, about one-sixth is in the hands of the communes, the crown forests occupy 675,000 acres, and the remainder belong chiefly to private individuals. The states of Hesse, Baden, Bavaria, Saxony, Wurttemberg, and Prussia are especially rich in forests. See section on *Flora*.

Manufactures. The industrial progress of Germany has been so marked in recent years as to make that country second in all Europe only to Great Britain as a manufacturing state. In 1910 nearly one-half the population was dependent upon manufactures and mining for a livelihood, as compared with 39 per cent in 1895 and 35 per cent in 1882. The growth in the manufacturing industries may be illustrated by the figures of production of certain leading articles of manufacture or those used in manufacturing (see *Mining*). Germany has in recent years taken second rank as a producer of pig iron, her product now exceeding that of England and being second to that of the United States. In 1897 the pig-iron production of the three chief iron-producing countries was Germany, 6,900,000 tons, Great Britain, 8,900,000, United States, 9,700,000. In 1911 the product was Germany, 15,200,000, Great Britain, 9,500,000, United States, 23,600,000. The number of spindles in the cotton mills was, in 1887, 4,900,000 and, in 1905, 9,000,000. The export of cotton yarns, which amounted to \$7,000,000 in 1900, was approximately \$16,000,000 in 1912; that of cotton piece goods, in 1900, \$60,000,000, in 1912, \$105,000,000; woolen and worsted yarns exported, in 1900, \$14,000,000, in 1912, \$21,000,000, woolen and worsted manufactures, in 1898, \$50,000,000, in 1912, \$63,000,000. The quantity of cotton exported to Germany from the United

States, her chief source of supply, was, in 1892, 482,000,000 pounds, in 1902, 853,000,000, and, in 1913, 1,222,000,000. According to the number of persons engaged, the most important industry is clothing, the next in order of importance being the building trades and the manufacture of foods, with over 1,000,000 workers each, if we put the third (metal industry) and fourth (machine and instrument making) together, the combined metal industry ranks second only to the clothing industry, next to these, and at the same time the most important feeder of the German export trade, is the textile industry, which forms the oldest and most important of the German industrial arts. The chief localities for the cultivation and preparation of flax and the weaving of linen fabrics are the mountain valleys of Silesia, Lusatia, Westphalia, the Harz, and Saxony (for thread laces), while cotton fabrics are made principally in Rhenish Prussia and Saxony. The same districts, together with Pomerania and Bavaria, manufacture the choicest woolen fabrics, including damasks and carpets. Since the formation of the Empire the textile industries have made remarkable progress, and the German manufactures now practically hold the home market and export to South America, Australia, the East, and even to England and the United States. The growth of the cotton industry can be judged best from the increase of imports of raw cotton, which amounted to about 10,000 tons in 1840, 71,000 tons in 1871, 403,000 tons in 1905, and approximately 550,000 tons in 1912. Prior to 1871 the production of cotton goods in Germany was less than that of France, but the transfer of Alsace, a great cotton-manufacturing community, to Germany made its product of this industry greater than that of France. The exports of cotton manufactures from Germany have grown from about \$25,000,000 in 1886 to approximately \$120,000,000 in 1912, the figures of the latter year including yarns as well as finished goods. Laces and embroideries have also become an important feature of the cotton industry and trade, the exports of machine-made laces to the United States alone amounting to nearly \$5,000,000 annually. The silk industry and the manufacture of velvet thrive especially in Krefeld, Barmen, and Elberfeld, besides Berlin, Baden, and Aix-la-Chapelle. Great progress has been made both in the quality and the quantity of the output, although in the higher grades France still remains unexcelled.

Woolen goods are also largely manufactured in Alsace, the Rhine provinces, Silesia, and Saxony, the leading products being carpets, shawls, table covers, hosiery, and furniture covers, the export of woollens alone amounting to about \$70,000,000 annually.

The iron and steel manufactures of Germany are among the most important in the world. The chief seats of this industry are Westphalia and Alsace-Lorraine, the Pennsylvania of Germany, next in importance are the district of Aix-la-Chapelle, and isolated districts in Saxony, Wurttemberg, Bavaria, and Hanover. Iron and steel furnaces, steel mills for the manufacture of billets, rails, bars, plates, wire, and other kinds of structural and railroad material turn out their products in enormous and constantly increasing quantities, not only for the domestic markets, but also for distant countries, in competition with Great Britain and

the United States. The number of workmen thus employed increased from 164,000 in 1880 to 458,296 in 1904, or more than 179 per cent, producing 2,571,000 tons in the former year and over four times as much in the latter. In certain branches of the iron industry Germany excels the rest of the world. In the hardware industry the words "Made in Germany" branded on an article are universally accepted as a guaranty of excellence. This applies chiefly to knives, scissors, needles, weapons, and instruments of all kinds. German scientific instruments set the standard for precision and workmanship. The famous Krupp works, employing over 70,000 workers in 1912, is the largest establishment in the world engaged in the manufacture of armor plates, heavy artillery pieces and projectiles, boilers, engines, and all kinds of half-finished products required in their manufacturing. The shipyards of Danzig, Kiel, Stettin, Hamburg, Bremen, and other seaports furnish a supply of merchant and navy vessels which occupy the highest place among the navies of the world for speed, durability, and equipment. The production of motor cars and boats in 1910 exceeded \$25,000,000 in value.

Germany is the largest beet-sugar-producing country, its share of the world's produce exceeding 30 per cent. The principal seats of this industry are in Prussia, Brunswick, and Anhalt. The number of sugar factories increased from 311 in 1871 to 342 in 1912, while the output increased from 263,000 tons in 1871 to 1,503,000 tons in 1904-05 and 2,632,000 tons in 1912. In the brewing industry Germany stands unrivaled. The best beer is made in Bavaria, numerous breweries, however, are to be found all over the Empire. Although the number of breweries has been steadily decreasing, their number in the beer-excite district (i.e., Germany exclusive of Bavaria, Wurttemberg, Baden, and Alsace-Lorraine) having been 11,564 in 1880 and 4204 in 1911, the production in this district increased from 474,124,000 gallons annually during 1875-84 to 910,000,000 gallons in 1911, and in the entire Empire from 859,188,000 gallons annually during 1875-84 to 1,570,000,000 gallons in 1911. The number of distilleries increased from 60,763 in 1895-96 to 67,236 in 1911, and the quantity of alcohol produced increased from 73,340,000 gallons to 80,122,000 gallons.

In silver, gold, and jewelry work Augsburg and Nuremberg dispute with Munich and Berlin for preeminence, the manufacture of scientific and musical instruments being also important in these cities, while Berlin and Leipzig are among the leading cities of Europe in respect to type foundries, printing, and lithography. In the manufacture of rubber and gutta-percha goods, glass and pottery ware, clocks, and carved wooden specialties, Germany occupies a leading position. The chemical industry excels that of all other countries, and the same may be said of dyeing and bleaching works. In 1907 there were 10,562 chemical plants employing 172,441 laborers. Just as the technical progress made by German industries in the last three or four decades can be compared only with that of the United States, so do their economic aspects resemble most closely those of the United States. The chief feature in common is the growing concentration of industry. In no other country save the United States are the number and power of large industrial organizations so great,

and at the beginning of 1906 there were no less than 385 distinct associations for controlling output and prices.

The disposition to increase the size of manufacturing establishments rather than increase the number is manifest in Germany as in the United States. The number of large establishments has shown a much greater per cent of increase than the number of small ones. This has led to the omission from the German reports, as in the case of the United States census, of the household and neighborhood industries and renders difficult a measurement of growth as to numbers of establishments, employees, or output, except as to very recent years. The number of employees in "factories and similar establishments" was reported at 5,054,000 in 1903, 5,361,000 in 1904, and the "total population engaged in manufactures and mining" in 1910, 6,618,000.

Railways Germany has the largest railway system in Europe, its railway density being second to that of the United Kingdom. The railroad industry employs half a million persons and represents a capital investment of about \$4,000,000,000. The first railway built in Germany was the Ludwigsbahn, connecting the cities of Nuremberg and Furth in Bavaria (a distance of about 4 miles) and opened for traffic in December, 1835. Trains began running on the Leipzig-Dresden line in 1837, and Prussia built the Berlin-Potsdam line in 1838. By 1846 only the minor states had no lines. The railways at that time were, however, distributed over the country in closely knit groups, each centering around some large city, only in the north were the lines connected. During the next 30 years railway construction was pushed with great energy, with a view to covering the old trade routes and important highways. The following table shows the growth of railways from their inception until 1913.

YEAR	Total length of railways, miles	State lines Length in miles	Private lines operated by the state	Private lines privately operated	Per cent of state lines to total
1835	4			4	
1840	341	29		312	8.5
1850	3,753	1,299	311	2,143	34.6
1880	20,627	1,040	2,634	7,591	50.4
1900	30,454	28,052	90	2,587	92.1
1906	35,509	32,283		3,227	90.9
1913	39,065	36,139		2,900	92.1

The most interesting fact brought out by the table is the increasing activity of the state in German railway industry. The German Empire as such does not own, however, the railways, the state lines being owned separately by the various states. Attempts to put the Imperial government in possession of the entire railway system have not been lacking, but thus far they have all failed because of the separatist sentiment, especially in the smaller southern states. At present each of the German states has a railway system of its own, largely owned and operated by the respective governments, a small portion remaining in private hands. Prussia is the most important railway owner, besides the Kingdom of Prussia only seven other states own more than 1000 kilometers (621 miles), their respective lengths in 1912 being as follows: Prussia and Hesse, 23,771 miles; Bavaria, 5183 miles, Saxony, 2058 miles,

Baden, 1093 miles, Alsace-Lorraine, 1301 miles; Wurttemberg, 1293 miles, Mecklenburg-Schwerin, 681 miles. Thus Prussia controls the railway situation by holding three-fifths of the entire system, and the eight largest states of the country have more than 90 per cent of all the railway lines. The number of miles of railway per 1000 square miles of area is in Germany 188, France 154, Austria 115, Netherlands 153, Italy 99, United Kingdom 193, United States 85.

Shipping and Navigation The shipping interests of Germany are second only to those of Great Britain and the United States, but while the merchant marine of the United States is engaged mainly in the coasting trade, that of Germany is engaged primarily in foreign commerce. On Jan. 1, 1913, the German merchant marine (only ships of more than 17.65 gross tonnage being considered) comprised 3,153,724 tons, of which 2098 steamers had 2,655,096 net tonnage and 2752 sailing vessels had 498,228 net tonnage. The increase in the net tonnage of the merchant fleet from 1875 to 1911 was 173 per cent, the steamers having gained 1281 per cent. The merchant marine of the Empire employed 75,130 persons in 1912, against 39,600 in 1881 and 40,400 in 1891. The number of vessels entering and clearing German ports was 224,268 with 60,134,000 tons in 1910, about 60 per cent of the total shipping was carried in German bottoms, while 20 years before only about 32 per cent of the total shipping was in German hands.

The principal countries participating in the shipping of the German Empire are Great Britain, with about 55 per cent of the total foreign shipping of the country, Sweden, with about 12½ per cent, Denmark, with nearly 12 per cent, Norway, over 8 per cent, the Netherlands, over 4 per cent, and Russia, with 3 per cent. The principal ports in the order of their importance are Hamburg, Bremen, Stettin, Danzig, Lubeck, Kiel, and Königsberg, the first of these ranking close to London and New York in the amount of its shipping.

Commerce The foreign commerce of the German Empire is subject to the regulations of the federal authorities, all of the states of the Empire together with Luxemburg joining in the so-called Zollverein, or customs union. A few districts in Baden and on the Switzerland frontier, also the free haven of Hamburg, Bremen, Bremerhaven, and Cuxhaven, and Emden are still unincorporated. Absolute free trade exists between the members of the union, and a uniform tariff is applied to all goods coming to any of the states from foreign countries. In fact, the commercial regulations governing the customs union are exactly like those applying to the commercial relations of the individual States of the United States, and of each of those to the Federal government, with the single exception that in the United States all customs duties collected enter the Federal Treasury to be used solely by the Federal government, while in the German Empire the surplus over a certain sum is distributed among the members of the customs union in proportion to their population.

Germany is second only to Great Britain in the volume of foreign trade. Unlike the United States, but like Great Britain, Germany imports more than it exports. In considering statistics of German commerce it is necessary to distinguish between "general commerce," which includes all imports and exports entering or leav-

ing Germany, and "special commerce," which includes only imports from foreign countries for consumption in Germany and exports of German products. The geographical position of Germany in the middle of Europe favors a large transit trade, which swells the difference between "general" and "special" commerce to considerably more than a quarter of a billion dollars a year. The following table shows the growth of special commerce since the formation of the Empire.

YEAR	Imports	Exports
1872	\$824,670,000	\$593,096,000
1880	676,872,000	708,288,000
1890	1,016,974,000	811,580,000
1897	1,157,870,000	901,068,000
1900	1,438,234,000	1,131,214,000
1901	1,420,146,000	1,132,642,000
1904	1,633,695,000	1,265,074,000
1905	1,769,839,000	1,390,348,000
1912	2,544,557,000	2,131,718,000

Owing to the enormous industrial progress in the last few decades, Germany has become an importer of foodstuffs and raw material and an exporter of manufactured products. Nearly one-third of the total imports consists of foodstuffs and other articles of consumption, raw materials and partly manufactured for industrial purposes constitute over one-half of the total, manufactured commodities make up less than one-fifth and are progressively diminishing, the remainder consists of the precious metals. The principal articles of export are textiles, half finished and finished metals, manufactured food products, chemicals, machines, tools, and apparatus, coal, and leather goods. The exact proportions of the four great classes of merchandise in the commerce of 1910 were as follows:

	Imports	Exports
	Per cent	Per cent
Raw and partly manufactured materials	56.9	25.7
Food and animals	27.8	10.0
Manufactures	15.3	64.2

The history of the commercial relations of the German Empire with other countries may be divided into three periods: (1) that of free trade, (2) the tariff period, and (3) the treaty period. During the first period, which lasted from the foundation of the Empire to 1879, there was a strong tendency to free trade, and duties so far as levied affected only a small number of articles, and that very slightly, being raised mainly for revenue purposes. In 1879 a new customs tariff went into effect as the result of prolonged agitation on the part of the joint agricultural and industrial forces, who were clamoring for the protection of home industries. That tariff has undergone numerous changes since the year of its promulgation, but the most important change—the one which marks the third period, since 1891—is that it has come to serve merely as an abstract basis for German foreign commercial relations, the real controlling factor being the tariff treaty or convention with respective foreign countries. The general tariff is called autonomous to distinguish it from the special or treaty tariff. According to existing methods every country which has a commercial treaty with Germany—and this is

the case of nearly all countries of importance—enjoys the privilege of a much lower tariff than the autonomous one, in consideration of reciprocal concessions made to German goods, but those countries which make any discrimination against German goods may be subjected to an additional tariff, which may be several times the amount of the autonomous tariff on all products enumerated therein and a high duty on all goods on the free list. The Tariff Law of 1902, which took effect in March, 1906, increases the duties on cereals from 120 to 250 per cent, compared with the autonomous tariff of 1879, on canned and preserved goods, between 50 and 360 per cent, on machinery and implements, between 60 and 110 per cent. The new duties have been reduced by treaties with the leading nations of Europe and South and Central America, but no treaty has yet been concluded with the United States, which, however, enjoys most favored nation treatment by special agreement. The chief countries participating in German trade are

COUNTRY	Per cent of total imports into Germany				Per cent of total exports from Germany			
	1890	1900	1905	1910	1890	1900	1905	1910
United States	9.5	16.9	13.5	13.2	12.2	9.3	9.3	8.1
Great Britain	15.0	13.9	10.5	8.6	20.7	19.2	18.1	14.7
Russia	12.7	11.9	14.7	16.2	6.1	6.8	6.3	8.0
Austria-Hungary	14.0	12.0	10.4	8.1	10.3	10.7	10.2	11.1
France	6.2	5.1	5.5	5.4	6.8	5.8	5.0	7.3
Argentina	1.8	3.9	5.0	4.2	—	1.4	2.3	2.5
British India	3.0	3.7	3.7	4.6	—	1.2	1.5	1.6
Belgium	7.4	3.6	3.7	3.5	4.4	5.3	5.4	5.7
Netherlands	7.3	3.6	3.5	3.4	7.6	8.3	7.7	7.2
Italy	3.3	3.1	2.9	3.0	2.8	2.7	3.0	3.0
Switzerland	4.1	2.8	2.6	2.1	5.3	6.2	6.3	6.1

One of the most significant facts brought out by the table above is the high position of the United States in the foreign trade of Germany. In the commerce of the United States Germany stands next to Great Britain, occupying the second place in imports and third in exports, sending, in 1913, 10.43 per cent of all imports and taking 13.45 per cent of exports. But while the imports from Germany to the United States have risen only about 100 per cent as compared with 1891, the exports of the United States to Germany increased more than 200 per cent during that period, as the following table shows:

YEAR	Exports to Germany from the United States	Imports from Germany into the United States
1891	\$92,795,000	\$97,316,000
1897	125,246,000	111,211,000
1901	191,780,000	100,445,000
1905	194,220,000	118,238,000
1913	331,684,000	189,963,000
1914	344,794,276	189,919,000

The most important German imports from the United States are cotton, copper, lard, petroleum, lumber, wheat, maize, dried fruits, machinery, and meats. Up to about the year 1900 all classes of American imports showed a rising tendency, since then, however, a decline has set in in the importation of American food products, excepting dried fruits, due in large part to the fact that the United States has less foodstuffs for export than in earlier years, while the importation of those raw materials which are indispensable to German industry has continued

to increase. The following table shows the movement of the leading American imports since 1897, and brings out clearly the reduction that has set in of late years in the importation of American food products due to the small supply which the United States has for exportation.

LEADING IMPORTS FROM THE UNITED STATES

(Millions of dollars)

	1897	1901	1904	1905	1913
Cotton	40.7	55.5	80.3	69.9	146.1
Copper	12.1	14.7	28.5	32.0	41.7
Petroleum	10.8	13.4	14.5	12.4	9.3
Lumber	3.5	3.9	6.3	8.5	9.1
Dried fruits	2.2	2.0	4.5	4.2	4.7
Lard	14.2	19.3	15.5	20.2	19.7
Wheat	7.5	39.3	6.3	2.3	12.1
Maize	15.1	19.5	4.6	12.7	3.7
Fresh meats	5.1	3.6	0.9	2.9	0.7

The United States supplies to Germany about three-fourths of its cotton, nearly nine-tenths of its copper, and almost the whole of its lard importation. The total value of exports from the United States to Germany has grown from \$187,347,889 in 1900 to \$331,684,212 in 1913; the imports from Germany have grown from \$97,347,700 in 1900 to \$188,963,171 in 1913, the excess of exports over imports from \$89,973,189 to \$142,721,141. In considering the balance of trade, it should be noted, however, that it is not really so unfavorable to Germany as it appears on the face of the export and import figures. The trade of America with Germany is carried on in German vessels, and the freight charges on American goods constitute no unimportant German asset against the United States, likewise the large sums paid annually by American travelers to German steamship companies. The principal imports of Germany in 1912 were as follows.

(Millions of dollars)

Agricultural products and foodstuffs	1641.0
Mineral raw materials	242.7
Textile materials and manufactures	201.2
Base metal and manufactures thereof	131.3
Chemical and pharmaceutical products	90.3
Precious metals and manufactures thereof	96.5
Leather and leather goods	37.9
Machinery and electrotechnical goods	26.8
Manufactures of wood	20.9
Books, statuary, and pictures	9.8

The principal exports of Germany in 1912 were as follows:

(Millions of dollars)

Agricultural products and foodstuffs	397.4
Base metal and manufactures thereof	390.1
Textile materials and manufactures	346.0
Machinery and electrotechnical goods	241.1
Chemical and pharmaceutical products	195.2
Mineral raw materials	180.7
Leather and leather goods	120.3
Paper and paper goods	52.4
Firearms, clocks, and toys	52.1
Precious metals and manufactures of	49.8

For an account of the colonial commerce of Germany, see *Colonies* in this article.

Banking. At the head of the German banking system is the Imperial Bank (the Reichsbank). Founded in 1875 by an Act of the German Reichstag, it has been ever since the leading bank of issue and, in addition to other banking operations, has served as the depository of the Imperial Treasury. Although practically a private stock company, its management is vested in a board of directors appointed by the

government and subject to the orders of the Chancellor of the Empire. The stockholders are represented by a general assembly, electing in turn a central committee, which makes monthly examinations of the affairs of the bank, and whose consent or advice is asked in certain matters by the board of directors. The bank keeps on deposit all moneys intrusted to it by the Imperial Treasury and attends to all collections and disbursements on its account without any compensation. Nor are the financial advantages derived by the government from the operations of the bank limited to that alone. The profits of the bank are distributed as follows: first, an annual dividend of $3\frac{1}{2}$ per cent on the capital stock of 180,000,000 marks (\$42,840,000) is distributed among the stockholders, second, 10 per cent of the remaining surplus is added to the reserve fund, third, the remaining surplus is divided in the proportion of one-fourth to the shareholders and three-fourths to the Imperial Treasury.

The Imperial Bank of Germany is not the sole bank of issue in the country. At the time of the enactment of the bank regulations for the Empire, in 1875, 32 other banks were authorized to issue bank notes, the total uncovered note circulation having then been fixed at \$91,630,000, of which \$59,500,000 were allotted to the Imperial Bank and the remainder apportioned among the rest according to their capital stock. Since then the number of these banks has gradually diminished, the allotment of the bank-note issue of all such being transferred to the Imperial Bank. In 1914 only the following five banks still retained the right of issue:

	Capital stock	Authorized note issue
Imperial Bank	\$42,840,000	\$130,900,000
Bavarian Bank of Issue	1,785,000	7,616,000
Saxon Bank	7,140,000	3,991,498
Württemberg Bank of Issue	2,142,000	2,380,000
Bank of Baden	2,142,000	2,380,000
Total	\$56,049,000	\$147,267,498

These banks may issue notes also in excess of the allotments indicated above, but all such amounts are subject to a tax of 5 per cent. The growth of the business of the Imperial Bank from the time of its foundation may be seen from the following figures: the total amount of all kinds of transactions had increased from \$8,734,000,000 in 1876 to \$103,500,000,000 in 1910. An important business carried on by the Imperial Bank is that in connection with its clearing-house department. The latter was founded in 1883, and the volume of clearings is behind only those of the London and New York houses, exceeding \$4,760,000,000 per annum. Since its organization clearing houses have been established in 22 other cities of Germany, the more important being in Frankfurt, Stuttgart, Cologne, Leipzig, Dresden, Hamburg, Nuremberg, Hanover, Mannheim, Dortmund, Elberfeld, Breslau, Chemnitz, Munich, Berlin, Brunswick, and Bremen. In addition to the banks of issue and the branch banks mentioned above, there are about 400 other banks organized as stock companies, whose total capital stock in 1910 exceeded \$683,800,000, besides numerous private banks, some of which, like the Rothschilds or Bleichroder, are among the foremost banking

institutions of the world. There are also several mortgage banks (*Hypothekenbanken*—credit foncier) to minister to the wants of the agricultural population, people's banks (*Volksbanken*) or cooperative loan associations which lend small amounts to needy artisans and owners of workshops, and finally the Prussian Maritime Association, for a description of which, as well as of the most important Berlin banks, the reader is referred to the paragraph on *Banking*, under PRUSSIA. Of savings banks there were in Germany 3039, with 7186 branches, in 1911. The number of accounts was 22,350,000, and the aggregate deposits amounted to \$4,241,000,000, while the deposits in the postal savings banks amount to over \$1,000,000,000. In German banking, as in German industry, there prevails a strong tendency towards unification and concentration.

Government. The constitution of the Empire bears the date of April 16, 1871. It is a written instrument and enumerates with considerable detail the powers and relations of the different organs of government. It may be amended by the Imperial Legislature, according to the usual processes of legislation, except that 14 negative votes in the Federal Council will defeat an amendment, and that those provisions which guarantee specific rights to individual states are unamendable. The Empire which this constitution created consists of 26 states, four kingdoms, six grand duchies, five duchies, seven principalities, three free cities, and Alsace-Lorraine, all under the presidency of the King of Prussia, who bears the title of German Emperor (Art II). It is not, however, a union of equals, for some of the states enjoy specific privileges which do not belong to others. Of these, Prussia is the most highly favored. She has the hereditary right to the presidency of the union, her Prime Minister is the Chancellor of the Empire, her representation in the Federal Council is large enough to prevent changes in the constitution without her consent, she has the casting vote in case of a tie in the Federal Council, and the chairmanship of all the standing committees except one in that body. Among the states upon whom special privileges were bestowed as inducements to enter the union are Bavaria, Württemberg, and Baden. They are all exempt from Imperial excises on domestic liquors and beer, while Bavaria and Württemberg have their own postal and telegraph systems and, with certain restrictions, their own military systems. Bavaria, moreover, is exempt from the operation of the Imperial laws for the regulation of railroads except for purposes of military defense and from the Imperial law of residence and settlement. Bavaria, Württemberg, and Saxony are entitled to seats in the standing committees of the Federal Council on Foreign Affairs and on Army and Fortifications, the chairmanship of the first-mentioned committee belonging to Bavaria. The constitution contains a guarantee that no state so privileged shall be deprived of its rights without its consent (Art LXXVIII). The German Imperial government may be described as a federal representative system, containing democratic and elective elements on the one hand and monarchic and hereditary elements on the other. Its federal feature is shown in the constitutional division of the powers of government between the central government and the state governments and the marking out of a sphere of activity for each. The elective and democratic

elements appear in the structure of the Reichstag, or National Diet, while the presidency of the Empire furnishes the monarchic and hereditary features. In regard to the methods of governing, the Imperial rule is not parliamentary in the sense of parliamentary government in England, as there is no provision for a responsible ministry.

For the purposes of legislation the constitution provides for a national Parliament, the Reichstag, representing the nation as a whole, and the Federal Council, or Bundesrat, representing the individual states. The latter is, to a certain extent, modeled after the old Diet of the Confederation. It is composed of delegates chosen by the governments of the several states that compose the Empire. They are without definite tenure and are apportioned without much regard to population, but according to the artificial plan of the old confederation. The number of votes in the Bundesrat, or Federal Council, is 61, of which Prussia has 17, Bavaria six, Saxony and Württemberg four each, Baden, Hesse, and Alsace-Lorraine three each, Brunswick and Mecklenburg-Schwerin two each, and the other states one each. The members have the character of ambassadors and are entitled to the same privileges that are accorded the diplomatic representatives of foreign states. They vote according to instructions from their governments, and uninstructed votes are not counted. In case a state has more than one vote, the delegation from the state must vote as a unit, but the entire vote to which the state is entitled may be cast by a portion of its representatives. It is left to each state to prescribe the qualifications of its representatives in the Federal Council. The Imperial constitution and the statutes, however, prescribe a number of disqualifications, most of which relate to the holding of other incompatible offices at the same time.

The Reichstag consists of representatives chosen for a term of five years by direct universal suffrage and secret ballot. By universal suffrage is meant the suffrage of all male citizens who have attained the age of 25 years. Those who are in active military or naval service, those who are subject to guardianship, or who are bankrupt or insolvent, or in receipt of poor relief, or condemned to the loss of civil or political rights, are disqualified from the exercise of the suffrage. There are at present 397 members of the Reichstag, the number as well as the character of the constituencies having remained unchanged since 1874. Of these Prussia has 236, or about three-fifths of the whole number. They are chosen by single district ticket and are uninstructed. A Law of May, 1906, provides for the payment of members. The power of calling, opening, adjourning, and proroguing both the Reichstag and the Federal Council and of dissolving the former (with the consent of the latter) is a prerogative of the Emperor. He must, however, call them annually, and in case of a dissolution he is bound to order the elections within 60 days and call the new Reichstag together within 90 days. The Reichstag is the judge of the elections and qualifications of its members and has power over its own internal organization and procedure, except that its sessions must be public. There are constitutional limitations, however, on the power of the Federal Council in this respect; for the president is designated by the consti-

tution, and the membership of some of its important standing committees is determined by the same authority. So far as the initiation of legislative measures is concerned, the two representative bodies are theoretically on an equality. At the same time it is the Federal Council which initiates all important legislation. In the Federal Council each government represented may introduce measures, and it is made the constitutional duty of the president to submit them to deliberation. In the Reichstag the initiation of measures is regulated by a rule of the House.

Unlike the French Parliament, the powers of the German Imperial Legislature are enumerated in the constitution. They include the regulation of foreign and interstate commerce, with certain exceptions in the case of Bavaria and Württemberg, the regulation of the monetary system, the regulation of the criminal law, private law and judicial organization and procedure throughout the Empire, the regulation of citizenship, medical and veterinary practice, the regulation of the customs and the excise upon tobacco, salt, spirituous liquors, beer, sugar, etc., the regulation of the military and naval systems, the enactment of measures for the execution of the laws, and the settlement of constitutional conflicts within a state in certain contingencies. It will be seen from the enumeration that the power of the German Legislature extends to many subjects which in other states having the federal system of government are left to the regulation of the individual states. As a general thing, the power of the Imperial Legislature over these subjects is not exclusive, but they may be regulated by the states in the absence of Imperial legislation. Moreover, in the domain of interstate and foreign relations, the individual states may conclude treaties among themselves for the regulation of their postal and telegraph communication, and even with foreign countries for the regulation of matters of local concern, and to that end may send and receive ambassadors. There has never developed a state's rights doctrine in the German Empire, for the reason that the federal union was not the result of an agreement among the states, as in America, but was called into existence by war and coercion on the part of Prussia.

The Imperial executive power is vested in the King of Prussia, who is president of the union, and who bears the title of German Emperor (Art. II). The succession is regulated by the Prussian constitution, which makes the crown hereditary in the male branch of the royal house by right of primogeniture and agnatic lineal succession. During the minority of the King the regency is held by the nearest agnate, or, if there be no such agnate, then the Prussian Landtag shall choose a regent. The King attains his majority at 18 and is irresponsible and inviolable. As Emperor, he is vested with the power of appointing and receiving ambassadors, other public ministers, and consuls, of negotiating treaties, of waging defensive war, and, with the consent of the Federal Council, offensive war, of commanding the army and navy, of promulgating the laws and supervising their execution. He has no veto on Imperial legislation. In supervising the execution of the Imperial laws, which are for the most part administered by the state governments at their own expense, he addresses himself, through the

Chancellor, to the state executives, and in case of their refusal to carry out the Imperial will, resort is had to federal execution—i.e., force is brought to bear upon the recalcitrant state (Art. XIX). In the enforcement of the laws, however, for the collection of the Imperial taxes and for the regulation of postal and telegraphic administration, the Emperor does not rely upon the states, but acts through Imperial officials. He appoints all the officials in the Imperial service and may dismiss them. There is an exception, however, in the case of the Imperial judicial officers, who are appointed by the Emperor upon the nomination of the Federal Council, and who cannot be removed by the Emperor. In addition to these powers, which belong to the president of the federal union as Emperor, he has a series of important functions as King of Prussia.

The constitution requires that all the official acts of the Emperor except those which relate to the command of the army shall be countersigned by an officer called the Imperial Chancellor, appointed by the Emperor and removable at his pleasure (Art. XVII). By this act the Chancellor assumes responsibility for the measure, thus insuring the irresponsibility of the Emperor. The Chancellor's responsibility, however, is not to the Legislature, but to the Emperor, for the parliamentary system of government does not exist in the Empire. If, therefore, the Reichstag refuses to pass his measures or votes a resolution of censure against him, he does not resign, but continues to hold his office, and if he thinks the action of the Reichstag is not the will of the people he may request the Emperor to dissolve it and order a new election. In recent years there has been a movement looking to the establishment of ministerial responsibility. Several notable precedents have been made. In 1908 Chancellor von Bulow resigned soon after the Reichstag failed to pass his inheritance tax bill. On Jan. 30, 1913, a resolution of "no confidence" passed the Reichstag because of Prussia's attitude towards the Poles, on Dec. 4, 1913, another such resolution passed the Reichstag on account of the conduct of the military authorities at Zabern in Alsace. The Chancellor is president of the Federal Council and has a seat in the Reichstag, where he appears as the chief defender of the policy of the government and the champion of its measures. He is also the head of the Imperial administration and supervises in the name of the Emperor the execution of the Imperial laws. To aid him there are at present 13 departments of administration, each under the control of a secretary. They are not his colleagues, but his subordinates; for there is no Imperial cabinet in the sense in which the term is usually understood. A Law of 1878 authorizes the Chancellor to appoint a responsible vice-chancellor to aid him when, from pressure of business or other cause, he is unable to discharge his duties. It should also be noted that another important organ of administration is the Federal Council, in fact, the German commentators on the Imperial constitution treat it as an organ of administration rather than as a chamber of the Legislature. Its most important administrative functions are the formulation of rules for the guidance of the administration, the preparation of the ordinances necessary for the execution of the laws, the issuing of decrees for the coercion of recalcitrant states of the Empire, and a wide

participation in the appointment of Imperial officials. Under the last head may be mentioned the nomination of the judges of the Supreme Court of the Empire (*Reichsgericht*) and the election of the members of the Imperial Court of Accounts. In spite of a democratically elected Reichstag, the German government is essentially an autocratic one. The Reichstag is the voice, but not the will, of the German people, hence its main function is merely to criticize. It is still in the protesting stage of parliamentary development, not unlike the English House of Commons in the time of the Stuarts. The predominant body, then, is the Federal Council, but this chamber is controlled by Prussia, where the King is all but absolute, asserting openly the doctrine of "divine right." So it follows that while the Kaiser directly exercises little power, indirectly as King of Prussia he completely shapes the policies of the Empire. The citadel of absolutism in Germany is Prussia and for this reason the radical elements in Germany have turned their attention to the democratization of Prussia.

When we turn to the judicial system of the Empire, we find few provisions in the constitution which bear upon the subject—no provision for a supreme court or inferior courts, no apportionment of judicial power between the Empire on the one hand and the states on the other, according to the federal system of government, and no guarantees of judicial procedure such as constitute so notable a feature in the Constitution of the United States. The only judicial tribunal in the Empire which has a constitutional basis is the Federal Council, which is designated as a court for the settlement of public-law controversies between states and of constitutional conflicts within states, in both cases when appealed to by one of the parties. With these exceptions everything relating to the organization, jurisdiction, and procedure of the German courts is left to the regulation of the Legislature, thus making the judicial system a purely statutory creation. It was not until 1877 that the Imperial Legislature passed an act for the organization of the courts (*Gerichtsverfassungsgesetz*). At the same time Imperial codes of civil and criminal procedure were completed and, with the Imperial Judiciary Act for the organization of the courts, went into effect Oct. 1, 1879. An Imperial code of criminal law was completed in 1870 and revised in 1871 and 1876, and more recently (1900) an Imperial civil code was put in force.

The result of all this legislation was the creation for the Empire of a uniform system of courts organized upon Imperial plan, and applying the law, which is not uniform throughout the Empire, according to a uniform system of procedure—an achievement which has done much to bring about the unification of the German states. The Imperial Judiciary Act of 1877 created a system of courts of four grades, the lowest being the district court (*Amtsgericht*). This is a court of first instance for the trial of petty civil and criminal cases. When hearing civil cases, the court is held by a single judge, in criminal cases the judge associates with himself two laymen called *Schoffen*. Next above the district courts are the territorial courts (*Landesgerichte*), consisting of from three to five judges and divided into civil and criminal chambers. They hear appeals from the lower courts and have a more extensive original

jurisdiction in civil and criminal matters. For the trial of important criminal cases jury courts are constituted periodically in connection with the territorial courts. They consist of a bench of three judges and 12 jurors. Next in the hierarchy are the superior courts (*Oberlandesgerichte*), likewise divided into civil and criminal senates, the usual number of judges in a criminal senate being seven. They have no original jurisdiction, being exclusively courts of appeal from the territorial courts. At present there are 28 superior courts in the Empire, 15 of which are in Prussia. As a result of a special provision, Bavaria alone has an *Oberstes Landesgericht* of 15 judges, which has its seat at Munich. Standing at the top of the judicial hierarchy is the Imperial Court (*Reichsgericht*), which has its seat at Leipzig in Saxony. It is composed of four criminal senates and six civil senates, with an aggregate membership of over 90 judges. The judges are appointed by the Emperor, upon the nomination of the Federal Council. Their tenure is for life, and they are immovable by any authority except the court itself acting as a disciplinary tribunal. The Imperial Court has no original jurisdiction in civil matters. Its appellate jurisdiction in civil matters extends to cases appealed from the superior courts, the consular courts, and the Imperial Patent Office Administrative Court. The criminal jurisdiction of the Imperial Court extends in first and last instance to all cases of high treason against the Emperor or the Empire, to appeals in certain cases from the decisions of the territorial courts and the jury courts, and to appeals from decisions of the consular courts.

The position of the judiciary is one of absolute independence of the administration. The judges can neither be removed, transferred to less desirable judicial stations, nor retired on pension against their will. All the judges (except those of the Imperial Court), about 8000 in number, are appointed and paid by the governments of the states in which they discharge their functions, and they are regarded as state judges, although their positions are created by Imperial law, and their qualifications and duties are prescribed by the same authority. Unlike the American, the German courts have no power to declare either state or Imperial laws unconstitutional.

The Germans—like the French, from whom they have borrowed many legal institutions—have attempted to separate the spheres of justice and administration and have accordingly intrusted the decisions of administrative controversies, not to the regular judicial courts, as is done in the United States and England, but to special tribunals called administrative courts, composed partly of trained jurists and partly of active administrators. The judges of the German administrative courts, unlike those of France, however, have a position of independence and cannot be removed at the pleasure of the Emperor, by whom they are appointed. The most important Imperial administrative courts are the poor-law board, the railway court, the patent-office court, and the marine office. If conflicts of jurisdiction occur between the administrative and judicial courts, the proper forum is determined by the Imperial Court, there being no provision for a tribunal of conflicts, as in France.

Finally, it should be said that there is little

or no Imperial local government in Germany, since the Imperial laws are for the most part administered by the state governments under the supervision of the Emperor. The chief local administrative activity of the Empire, therefore, consists of such supervisory service as may be necessary to insure the strict enforcement of the Imperial laws by the state authorities. For local government in Germany, see PRUSSIA.

Finances The finances of the Empire resemble, in a general way, those of the United States in that they embrace comparatively few items of revenue and expenditure. The Imperial government cannot levy any taxes except customs and excise duties. The bulk of its revenues is, therefore, derived from these two sources. Excise duties are levied on tobacco, beer, liquors, salt, and sugar. The post and telegraph, both of which are owned and operated by the government, the railways of Alsace-Lorraine, and stamp taxes bring in some additional revenue, which is, however, insufficient to cover the expenditures of the Empire. The deficit is covered by contributions from the several states called "Matricular Beirag," and levied on each state in proportion to its population. Prussia is assessed more than 60 per cent of the entire federal contribution.

The chief items of expenditure are those for the army and navy, which together absorb more than a third of the entire expenditure. The Imperial Treasury spends one-tenth of the budget, and for the service of the debt of the Empire stands the next largest item, exceeding \$54,000,000 per annum, or more than 5 per cent of the budget. The growth of the budget of the Empire from its foundation is shown in the following table.

YEAR	Budget	State contributions
1872	\$83,530,860	\$23,002,224
1882	141,217,776	24,582,782
1892	266,303,198	77,762,692
1902	559,238,596	135,882,054
1907	570,563,000	68,483,000
1913	879,650,000	62,196,560

The total debt of the Empire amounted in 1912 to \$1,177,418,000, of which about 6 per cent was unfunded. Of this, over one-half is at the rate of 3 per cent interest, the remainder chiefly $3\frac{1}{2}$ per cent. The first loan raised by the Imperial government was for more than \$3,808,000 in 1877. The growth of the debt since then has been as follows: 1880, \$51,897,804, 1890, \$266,079,716, 1900, \$547,043,000, 1905, \$790,993,000; 1912, \$1,177,418,000.

Army. The German army, as organized in peace, consists of 25 army corps, recruited as follows in territorial military districts in the Kingdom of Prussia, Baden, and Hesse, 16, the Prussian Guard Corps, from the entire kingdom, 1, in Saxony, 2, in Wurttemberg, 1, the Reichland (Alsace and Lorraine), 2, Bavaria, 3, in all, 25 army corps and 1 permanent cavalry division, which, with the active reserve troops, amounts to about 1,250,000 combatants. Adding to this 750,000, the strength of the Landwehr immediately available, Germany can mobilize at once about 2,000,000 trained men. In addition there are about 1,500,000 partially trained, a large number of garrison troops, and the Landsturm, or last reserve, which includes all the

able-bodied men not already called to the colors. In the German army provision for organizing the corps into armies is made by assigning corps to inspection districts, each of which is provided with a headquarters and staff. Normally 2 regiments of infantry (6 battalions) form a brigade, 2 brigades a division, and 2 divisions an army corps. There are 10 divisions, however, which have 3 brigades. To each infantry division is attached an artillery brigade of 12 batteries (72 guns), a regiment of 4 squadrons of cavalry, to each army corps, 4 batteries of howitzers, a pioneer (engineer) battalion, and a battalion of rifles (Jäger) are also attached. Cyclist companies, of which there are 18, are assigned as needed. Field batteries have 6 guns instead of 4, the number used in the French and United States army battery. The complete German division of 2 brigades has about 14,000 combatants, the corps of 2 divisions, 30,000. The division, increased in war to 3 brigades, gives 6 brigades to the war corps, amounting in all to about 43,000 combatants, as compared with 33,000 in the French army and about 44,000 in the two divisions of the field army of the United States.

There is but one permanent cavalry division. In war provision is made for the immediate formation of eight more from existing cavalry brigades, regiments, and squadrons. Strength, 3 brigades of 2 regiments each, with 2 or 3 batteries of horse artillery—in all, 24 squadrons and 8 or 12 guns. The French army, on the other hand, maintains 10 permanent cavalry divisions.

Unit of Organization Infantry—Four companies to the battalion, 3 battalions to the regiment, 2 regiments to the brigade, 2 brigades to the division, with one of the divisions in a corps having an extra battalion of sharpshooters (Jägers, or Schützen). The war-strength battalion counts about 25 officers and 1000 rifles, which gives for the war company about 250 as compared with the American company of 142 men.

Cavalry—Five squadrons to the regiment, 2 regiments to the brigade. The German squadron should not be confused with the American squadron. The former consists, on a war footing, of 6 officers and 172 men, the latter of 14 officers and 363 men, divided into 4 troops. One of the five German squadrons composing a regiment will probably be left at the regimental depot to collect and train recruits to supply the four squadrons in the field. See CAVALRY.

Field Artillery—Three batteries to the battalion, 2 battalions to the regiment, 2 regiments to the brigade, as in the United States army, except that the American battery has only 4 guns, like the French, the German light battery 6 guns. Horse batteries have 4 guns. In peace the batteries vary in strength from 4 officers and 102 men to 4 officers and 128 men. In war the battery counts 5 officers and 150 men, as compared with the American battery of 5 officers and 171 men. Each German battalion in war has in addition a light ammunition column of 4 officers and 188 men.

Foot Artillery—Organization varies greatly. A typical formation is 4 batteries to the battalion, 2 battalions to the regiment. There are 24 regiments. The heavy howitzer battalion numbers 1230 officers and men, including light ammunition train. One battalion of these is assigned to each corps in war. Each has 4

batteries of 4 guns each Field and foot (fortress) artillery officers are on one list Fortress artillery garrisons the land defenses Seacoast fortifications are under the navy, with one or two exceptions

Aeronautical Corps—Under the Law of 1913, 5 aeroplane battalions (17 companies) were organized There are at present (1914) between 25 and 30 dirigibles The total *personnel*, 173 officers and about 4500 enlisted men

Technical Troops—It is necessary to consider engineer and signal troops together if we wish to make any comparison between these organizations and those of the United States Germany divides troops of this class into pioneer troops, and *Verkerstruppen* (lit, communication troops). The latter are further divided into railroad troops, telegraph troops, aerostation and aviation troops, automobile troops, etc The 18 companies of cyclists are included in the strength of the infantry See ENGINEERS, CORPS OF

Supply Train It consists of 25 battalions Each battalion is composed of 3 companies and a bakery detachment Strength, 631 officers, 10,961 enlisted men

Sanitary Troops—About 2300 officers and 4500 men, capable of required expansion in time of war.

Veterinarians—Between 700 and 800 Horses, peace, 160,000

Officers—A noticeable feature of the German Officer Corps is the large number of nonregimental officers, about 3000, which makes it possible to perform all administrative and staff duties without depriving the line troops of their officers, as in the American system

New Laws—The effect of the Laws of 1911, 1912, and 1913 will result, at the end of 1915, in a considerable increase in the permanent peace establishment and consequently in the number of trained men available at the outbreak of war The intent of the Law of 1913 was to increase the annual number of recruits, the number of organizations, and the number of balanced units, and to decrease the average age of the men of the field army At the same time the "war chest" was increased from \$30,000,000 to \$90,000,000 in gold and silver For the year 1914 the military budget amounts to about \$300,000,000 The "war chest" is an additional cash emergency fund in the form of gold and silver

Total Peace Strength—It is estimated that the progressive increase of the standing army, provided for in the Law of 1913, will, in 1915, result as follows 669 battalions of infantry, 550 squadrons of cavalry, 642 batteries of field artillery, 55 battalions of foot artillery, 44 battalions of engineers, 31 battalions of communication troops, 25 battalions of supply troops, which, with miscellaneous small corps, staff, etc, aggregate the following numbers in the classes stated (the figures are given in round numbers) 36,000 officers, 10,000 officials, 18,000 one-year volunteers, 771,000 men, grand total, 835,000 for the standing army in peace in 1915

Total War Strength—The peace army raised to war strength under the provisions of the Law of 1913, by adding the active reserve, gives about 1,250,000 trained combatants for the initial mobilization, or first line army When to this is added 750,000 men composing the mobile Landwehre, or second line army, there re-

sults a mobile force of trained men amounting to approximately 2,000,000 In addition to this force it is estimated that there are about 2,500,000 wholly or partially trained men for home defense, made up of the second Ban of the Landwehr, of garrison units, and of the Landsturm, or last reserve, giving a grand total, for the defense of Germany, of at least 4,500,000 trained men Some estimates make this total 5,000,000, including untrained men France can mobilize about 3,500,000 in all

Colonial Troops—At the outbreak of the War in Europe (qv), 1914, there were at Kiaochow about 2700 marines and sailors, supplemented by native troops Colonial troops, not included in the army, 340 officers, 2250 noncommissioned officers and men, 3830 native soldiers In German Southwest Africa there was a German force of 150 officers and 2000 men In addition there were 600 native police with German officers

Administration—Under the constitution of the Empire the German Emperor is commander in chief of all the forces To the Bavarian troops, however, the oath of fidelity is not administered in time of peace Bavaria, Saxony, and Wurtemberg have their own war ministers, but are more or less subject to the control of the Prussian War Office

Arms—The infantry uses the Mauser magazine rifle, calibre 0.311 inch, the cavalry, the carbine of the same type Field and horse artillery use a Krupp gun firing a 15-pound projectile The light and heavy field howitzers fire 30- and 94-pound projectiles respectively The fighting strength of the German army, or the initial mobilization, is estimated at 1,000,000 rifles, 80,000 sabres, 5500 field guns, France, 650,000 rifles, 60,000 sabres, 3000 field guns

Service—Military service is obligatory, with certain exemptions Liability (*Wehrpflicht*) commences at 17 and ends at 45, active service (*Heerpflicht*) begins at 20 Every boy who enlists before 20 has a liability of only 19 years (1) Active service, first line army, is for 7 years, 2 with the colors and 5 in the reserve, except in the mounted branches, in which the periods are 3 and 4 In the active reserve training is for a period of not more than 8 weeks twice during the reserve period (2) Service in the first Ban (calling out) of the Landwehr (land defense), or second line army, is for 5 years Training for from 8 to 14 days twice during the period (3) Service in the second Ban of the Landwehr for 7 years. No training during this period Total service in the active army and Landwehr, 19 years, from the age of 20 to 39 (4) Service in the Landsturm (lit, land uprising) composed of 2 Bans—first Ban, composed of those between 17 and 39 who have received no military training, second Ban, composed of all between the ages of 39 and 45, whether trained or not This reserve is for home defense, receives no training, and may be called out only by Imperial decree, or, in case of imminent war, by corps commanders or fortress governors One-year volunteers (amounting to about 18,000), known as *Einjahrgreifwilligers*, made up of educated young men who pay their own expenses, are admitted and supply the commissioned *personnel* for the reserve and Landwehr troops The *Ersatz* (compensatory) reserve is composed of the annual surplus of those called to the colors They receive a certain amount of training Catholic clergymen, if ordained before the 1st of April of the seventh

year of their obligation, pass to the depot reserve, when they are exempt from drills. Young men born in the island of Heligoland before the 11th of August, 1890, are entirely exempt from military service.

Frontier—Seacoast and land frontier in all amounts to about 4600 miles. The country is divided into 10 fortress inspection districts, each including fortified places. The names of the districts and the fortresses on each are as follows: 1 *Königsberg* Königsberg, Danzig, Pillau, Memel, Boyen. 2 *Posen* Posen, Glogau, Neisse, Glatz. 3 *Berlin* Spandau, Magdeburg, Torgau, Küstrin. 4 *Mainz* Mainz, Ulm, Rastatt. 5 *Metz* Metz, Diedenhofen, Bitsch. 6 *Cologne* Cologne, Coblenz, Wesel, Saarlouis. 7 *Kiel* Kiel, Friedrichsort, Cuxhaven, Geestemünde, Wilhelmshaven, Swinemünde. 8 *Thorn* Thorn, Grandanz, Vistula Passages, Dirschau. 9 *Strassburg* Strassburg, New Breisach. 10 *Munich* Munich, Ingolstadt, Garmersheim.

These are all connected by wire, and railways are so located and operated as to concentrate the army most efficiently at threatened points of the frontiers.*

Navy. Previous to 1848 none of the states of northern Germany possessed naval forces. The blockade of the coast by Denmark in that year showed the value of a navy, and Prussia took immediate steps to organize one. It grew but slowly until the Schleswig-Holstein War, when the necessity for an adequate force became again very apparent. The growing Prussian navy became the navy of the North German Confederation in 1866, and this in turn formed the nucleus of the Imperial navy in 1871. It was not until 1882, however, that serious steps were taken to greatly augment it. In that year a definite building programme was adopted. This was supplemented by another in 1888. The increasing commerce and wealth of Germany and the manifest desirability of a navy commensurate with the interests of the nation brought about the formation of the German Naval League (which now has 3600 branches and 1,100,000 members) and an energetic fight, led by the Emperor, for a strong navy. This fight resulted in the naval laws of 1898, 1900, 1906, and 1912, hereinafter mentioned. After 1900 the growth of the fleet was very rapid.

The naval Act of 1900 is the real basis of the existing fleet. It embodied in definite legislation the future scheme of construction, providing for the building and maintenance of a fleet of 38 battleships of the most powerful type and a corresponding number of cruisers, torpedo craft, and auxiliaries, as well as an extensive expansion of the dockyards. The estimated cost of the fleet was \$370,000,000, and of the dockyards and other matters, \$100,000,000. The Act also provided for replacing the older ships when they reached a certain age. The Acts of 1906 and 1912 added materially to the force previously contemplated. The total programme as defined in 1912 is to be completed in 1923. It provides for 41 battleships, 12 battle cruisers, and 30 small cruisers for the fleet, and 8 large cruisers

and 10 small ones for foreign service. The active fleet (High Seas Fleet) will consist of 1 fleet flagship, 3 squadrons of 8 battleships each, 8 large and 18 small cruisers, and such torpedo craft as may be assigned. (See table hereinafter given.) The cost of the navy has grown with its size. In 1871 it was \$6,000,000, in 1881, \$6,750,000, in 1891, \$21,350,000, in 1901, \$51,400,000 and the budget for 1914-15, passed before war was foreseen, amounted to \$117,000,000.

As in the case of the army, the supreme command is vested in the Emperor, both in peace and war, and he alone presides over the whole navy. All questions upon which the different bureaus or divisions of the navy are not agreed are referred directly to the Emperor for his decision. The Emperor's principal aid is the Inspector General of the Navy. The department is divided into two administrative bureaus—the Imperial Navy Office, which deals with everything that involves expense, and the Admiralty Staff (Admiralstab), which deals with everything that relates to command (including the Naval Intelligence Office, plans of operation, mobilization, training, etc.). Aside from the chiefs of these bureaus, there are five other officers performing independent duties for which they are responsible to the Emperor alone. These are the commander in chief in the Baltic, the commander in chief in the North Sea, the chief of the High Seas Fleet, the chief of the Cruiser Squadron, and the Inspector of Training.

The personnel of the navy has been greatly increased since the beginning of the great war of 1914. Previous to the mobilization, by the provisions of the Naval Bill of 1914-15 it was to consist of 3760 commissioned officers and 75,468 men. The line officers provided for were 2 grand admirals, 5 admirals, 12 vice admirals, 22 rear admirals, 379 captains and commanders, and 1991 other line officers. The training of line officers consists of one year on a practice ship, one year at the naval school (at Murwik near Flensburg), six months divided between the gunnery school, torpedo training ship, and the marine infantry, and lastly one year's practice training in the active fleet. Engineer officers (about 600 before the mobilization) are first appointed to enlisted men's ratings, but wear a special uniform and are messes separately. They have first a three months' course of instruction in military matters, then nine months on vessels of the High Seas Fleet, followed by promotion to petty officer's rank, then two years' service as petty officers in large ships and destroyers, and one year at one of the engineering schools (Kiel or Wilhelmshaven), followed by promotion to warrant officer, next, four years' training in practice work (usually about two years of this in destroyers), and lastly one more year at an engineering school, followed by promotion (if qualified) to the rank of engineer (corresponding rank of sublieutenant).

The enlisted force consists of the *Fleet* and the *Seewehr*. Every German must serve either in the army or navy and cannot provide a substitute. The obligation commences at the age of 20 and continues seven years—the first three in active service and the remaining four in the reserve, when the annual exercises or manning of the fleet do not necessitate recall to service. Each reservist is obliged to take two training courses of eight weeks during the reservist period. At the end of seven years the men enter

*In estimating the military strength of armies, either in peace or in war, care must be taken, in consulting authorities, to note which organizations are included and which are omitted, which are without staffs and what staffs are without organizations, the size of the basic units in war and in peace, whether officers, officials, administrative services, colonial and native troops are considered, the character and numbers of the several reserve quotas of trained and partially trained men, and to what extent the latter are available for war service.

the *Seeuch*—in its first class for five years and in its second class until they complete their thirty-ninth year. There is also an *Ersatz Reserve*, composed of men who have not served from various causes, such as excess of numbers, domestic reasons, slight physical defects, etc. It serves to fill the vacancies in the complements when mobilization occurs. In addition to the men serving their three years in the fleet there are others who have volunteered for longer periods, and these include nearly all petty officers and other persons who perform duties not practicable for short-term men.

On Nov 1, 1914, the German fleet consisted of 16 battleships of the dreadnought type (3 others building), 22 older battleships, 3 battle cruisers (2 building), 9 armored cruisers, 39 cruisers and scouts (6 building), 152 destroyers (of these several lost—12 others building), 36 submarines completed (or nearly completed—at least one boat sunk in action, several boats building). The battle cruiser *Goeben* and the light cruiser *Breslau* have been sold to Turkey and are not included in the foregoing statement. The latest reports concerning the naval air craft give the number of airships as 5, ordinary aeroplanes and hydroplanes as about 60, but, as such craft can be built rapidly, doubtless the numbers have been much increased. The beginning of the organized air fleet was made in 1912, and though the disastrous accidents to L1 and L2 (see MILITARY AERONAUTICS) caused a temporary setback, the development of naval airships was soon resumed, partly through experiments with privately owned dirigibles, and revolving sheds for airships have been built at Cuxhaven and elsewhere.

The German fleets were organized at the beginning of the war as follows:

HIGH SEAS FLEET

Flagship *Friedrich der Grosse, 25d, 10g12, 22 k
1st b s Squadron 2d b s Squadron
(25d-10g12-22 k) (13d-4g11-19k)

(11d-4g11-17)

Worth

Brandenburg

8 armored coast defense vessels (4d-3g9 4-15k)

About 50 destroyers, probably mobilized in 4 flotillas

About 60 torpedo boats

Six protected cruisers of 6000 tons used in training

(NOTE Displacements are given in thousands of tons, thus, 12d is 12,000 tons, 5 5d is 5,500 tons, 0 55d means 555 tons, 4g12 means 4 12-inch guns constitute the main battery, 12g11 means that 12 11-inch guns are the main armament, 30k means 30 knots' speed, 3t means 3 torpedo tubes, b s means battleship, a c, armored cruiser, c, cruiser, des, destroyer, sub, submarine, * means dreadnought or battle cruiser.)

Germany has three navy yards. Two of them are large and splendidly equipped establishments—one at Wilhelmshaven in the Jade estuary and the other at Kiel. Both are fitted for repairing or building ships of the largest size. Kiel has two dry docks (and one building) of sufficient size to take any battleship, but they are too short for battle cruisers. Wilhelmshaven has four dry docks (and one building) for dreadnoughts, one of these capable of docking the largest battle cruisers. The third navy yard is at Danzig. It is fitted only for the building and care of small cruisers and torpedo craft.

The Imperial navy had no war experience previous to the great war of 1914. In the wars of 1864 and 1866 the navy of Prussia and of the North German Confederation achieved nothing. There were no important naval operations during the Franco-Prussian War, the navies of both powers exhibited a lack of energy and aggressiveness, the one single-ship action being a drawn battle in which neither side received much injury. See NAVIES.

Money, Weights, and Measures. Gold is the single standard of value, silver being legal tender only for amounts not exceeding 20 marks (less than \$5). The coming of money is in the hands of the Imperial government. The standard unit is the mark, whose value is 23 821 cents United States gold. The mark has 100 pfennigs. The old thaler is equivalent to 3 marks. The prevailing coins are the gold 5, 10, and 20 mark pieces, called the half crown, crown, and double crown respectively, the silver 1, 2, and 5 mark pieces, and bronze coins of smaller denominations.

The metric system has been in vogue since 1872.

Colonies. At the outbreak of the War in Europe (q v), 1914, the German colonies, or so-called protectorates, were Togo (acquired in 1884), Kamerun (1884), German Southwest Africa (1884), German East Africa (1885), German New Guinea (1884), German Samoa (1900), and the territory of Kiaochow (1897). German New Guinea included Kaiser-Wilhelmsland, the Bismarck Archipelago, and the German Solomon Islands, while administratively attached to it were the Micronesian islands acquired in 1899, viz, the Caroline, Pelew, Marshall, and Mariana islands (except Guam). The following table shows estimates for 1912

	AREA		POPULATION	
	Sq km	Sq m	Colored	White
Togo	87,200	33,668	1,003,240	372
Kamerun	790,000	305,019	3,500,000	1,537
Southwest Africa	835,100	322,432	87,770	14,816
East Africa	995,000	384,170	7,510,800	4,866
New Guinea	240,000	92,664	609,200	1,278
Carolines, etc	2,476	956		
Samoa	2,572	993		
Kiaochow (1913)	552	213	192,000	4,470
Total	2,950,900	1,140,115	12,903,490	27,339

The German colonial system is that of a pure absolutism administered through a centralized bureaucracy. Neither the natives nor the white inhabitants of the colonies have any voice in the fiscal or political administration of the territories. The laws for the colonies are framed by the Imperial Parliament, and German citizens residing in the colonies enjoy the same civil rights as in the mother country. The natives are not regarded as German citizens, but are allowed to acquire citizenship by naturalization in accordance with the general laws regulating such procedure. A fundamental law in respect to the administration of colonies was laid down by the Reichstag in 1886 and subsequently amended in 1887 and 1888. The only exception, whereby the native element is recognized in the administration of colonial affairs, is in the case of some of the districts where it was thought advisable to placate the native chiefs by making them the medium of communication between the Imperial government and the native population.

The decision as to the budget for the protectorates is nominally vested in the Emperor, though virtually it is in the hands of the Governor of the colony and his immediate subordinates. The revenue is derived from taxation, sale or lease of public property, fees, and subventions from the home government. There is a house tax applicable to both Europeans and natives. The rate of the tax is expressed in money, but the natives are allowed to offer produce or labor as the equivalent of the tax. The determination of the value of labor and natural products is left to the local authorities, thus permitting the exercise of a good deal of arbitrary power by the colonial officers. Moreover, "measures are provided for the enforcement of the tax, and for this purpose forced labor is permitted." Experience has shown that the system is productive of excessive hardships for the natives and affords opportunity for the display of great cruelty by the local officers. The revenues derived from the various sources in the protectorates are, however, generally far from being

sufficient to cover the necessary expenses, and the home government finds it necessary to grant large subventions from year to year. Extraordinary expenditures are generally met by loans. The excess of ordinary expenditure over the ordinary, or colonial, revenue is covered by Imperial subvention. Colonial revenue and expenditure respectively, for all the protectorates, have been as follows, in millions of marks: in 1901, 7.82 and 39.94, in 1903, 10.10 and 40.05, in 1904, 13.58 and 101.15, in 1905, 15.30 and 204.68, in 1906, 18.21 and 101.18, in 1909, 42.63 and 68.20, in 1910, 48.72 and 82.43, in 1911, 47.99 and 97.13. The total estimated receipts for the fiscal year 1914 were 157,538,000 marks, made up as follows: colonial receipts, 60,027,000 marks, territorial debt, 7,905,000, Imperial subvention, 31,961,000, loan, 57,600,000, "economies" (in Kiaochow), 45,000.

Colonial Commerce.—The combined imports and exports of the German protectorates increased from a value of 99,576,000 marks in 1902 to 193,101,000 in 1905, 254,692,000 in 1908, and 435,440,000 in 1911. Imports and exports have been as follows, in thousands of marks:

	1905	1908	1909	1910	1911
Imports					
Africa	62,514	84,264	97,613	119,400	130,131
Pacific Islands	8,858	7,593	9,799	9,441	12,081
Kiaochow *	69,176	69,041	65,464	69,375	114,935
Total	140,548	160,898	172,876	198,216	257,150
Exports					
Africa	23,438	37,726	53,264	82,643	81,579

Kiaochow *	24,717	47,344	54,732	60,561	80,295
Total	52,553	93,794	124,346	161,403	178,290

* With hinterland

Imports from and exports to Germany in 1910 amounted to 95,090,000 and 73,210,000 marks respectively, in 1911, 104,826,000 and 73,818,000. If we take into account the fact that the greater part of German imports into the protectorates, except Kiaochow, represents supplies sent there by the government for the use of its troops, officials, and public works, the value of the German colonial trade becomes unimportant.

Population. The following table shows the area in square kilometers and in equivalent square miles of the states of the German Empire, their de facto population according to the censuses of Dec 1, 1910, and Dec 1, 1905, the percentage of increase from 1905 to 1910 and from 1871 (the year in which the Empire was established) to 1910, and the population per square kilometer in 1910 and 1871. Political status is indicated thus: *k* kingdom, *g* grand duchy, *d* duchy, *p* principality, *fc* free city, *r* Reichsland (Imperial territory). Under Prussia are shown the constituent provinces, and under Bavaria are shown Bavaria proper (i.e., the eastern part) and the detached Palatinate (west of the Rhine).

The only countries in the world exceeding Germany in population are China, India, Russia, and the United States. During the past century German population has increased remarkably. The average annual increase from 1816 to 1864 was 0.96 per cent, from 1864 to 1910, 1.09 per cent, from 1816 to 1910, 1.02 per cent. The population in 1816 was 24,833,000;

in 1820, 26,294,000, in 1830, 29,520,000, in 1840, 32,787,000, in 1850, 35,397,000, in 1860, 37,747,000, in 1864, 39,392,000, in 1870, 40,818,000, in 1871, 41,058,792, in 1880, 45,234,061 (average annual increase from 1871, 1.08 per cent), in 1890, 49,428,470 (annual increase, 0.89 per cent); in 1900, 56,367,178 (annual increase, 1.31 per cent); in 1905, 60,641,489 (annual increase, 1.46 per cent); in 1910, 64,925,993 (annual increase, 1.36 per cent), in 1919, 59,857,283

The density of population per square kilometer in 1910 was 120.04 (equivalent to 310.9 per square mile). For the sake of comparison the density per square kilometer in other countries

June 30, 1912, was 66,146,000, and of the Zollgebiet (customs territory), 66,391,000, on June 30, 1914, 67,812,000 and 68,061,000

The foreign population at the 1900 census was 778,737, 1905, 1,028,560, 1910, 1,259,873 (of whom 542,879 female). Of the foreigners in 1910, subjects of Austria (with Liechtenstein) numbered 634,983, Netherlands, 144,175, Russia (with Finland), 137,697, Italy, 104,204, Switzerland, 68,257, Hungary, 32,079, Denmark, 26,233, France, 19,140, United Kingdom and colonies, 18,319, United States and possessions, 17,572, Luxemburg, 14,356, Belgium, 13,455

German subjects of non-German blood exceed

is here shown England, 268.3 (United Kingdom, 144.2), Belgium, 252.07, Java and Madura, 228.87, Netherlands, 171.36, Japan, 139, Italy, 120.94 (about the same as the density of Germany), Luxemburg, 100.49, China proper, 78, Austria-Hungary, 76.01, France, 73.82, Denmark, 70.75, British India and native states, 68.61; Portugal, 64.8, Spain, 38.66, European Russia (without Poland), 24, Russian Poland, 74, United States, 11.96 (the most densely populated States of the United States, Rhode Island and Massachusetts, had a density per square kilometer in 1910 of 196.5 and 162 respectively). In Germany the density varies greatly, being least in agricultural Mecklenburg-Strelitz (36.3); in the industrial kingdom of Saxony it is 320.6

The estimated population of the Empire on

4,000,000, of whom over three-fourths are Poles. Others are Czechs, Lithuanians, Wends, Danes, French, Frisians, etc. The Poles are found principally in Posen and Silesia, the Czechs in Silesia, the Wends in Silesia, Brandenburg, and Saxony (Kingdom), the Lithuanians in East Prussia, the French in Alsace-Lorraine, the Danes in Schleswig-Holstein. The Poles retain their ideal of nationality and are essentially a hostile element in the Empire. In 1910 Jews numbered 615,021, of whom two-thirds are in Prussia.

Urban and Rural Population—The increase in Germany's population is largely urban. The population in 1910 (64,925,993) was divided among 75,939 communes (Gemeinden). Communes with less than 2000 inhabitants are regarded as rural; these numbered 72,199, with

25,945,587 inhabitants. Communes with less than 100 inhabitants numbered 15,013, with a population of 822,406, communes with 100 to 499 inhabitants, 40,516, with a population of 10,250,420, communes with 500 to 999 inhabitants, 11,686, with a population of 8,090,857, communes with 1000 to 1999 inhabitants, 4984, with a population of 6,790,904. The urban communes, i.e., those having 2000 or more inhabitants, numbered, in 1910, 3740, with a population of 38,971,406. Communes with 2000 to 4999 inhabitants numbered 2441, with a population of 7,297,770, communes with 5000 to 19,999 inhabitants, 1028, with a population of 9,172,333, communes with 20,000 and less than 100,000, 223, with a population of 8,677,955, communes with more than 100,000, 48, with a population of 13,823,348. The number of communes in the several groups and their percentage of population on total population are shown below for various dates since the foundation of the Empire.

	YEAR	Number of communes	Percentage on total pop
Communes with a population of 2000 to 4999	1871	1,716	12.4
	1890	1,997	12.0
	1900	2,269	12.1
	1910	2,441	11.2
Communes with a population of 5000 to 19,999	1871	529	11.2
	1890	733	13.1
	1900	864	13.5
	1910	1,028	14.1
Communes with a population of 20,000 to 99,999	1871	75	7.7
	1890	135	9.8
	1900	194	12.6
	1910	223	13.4
Communes with a population of more than 100,000	1871	8	4.8
	1890	26	12.1
	1900	33	16.2
	1910	48	21.3
Total, urban population	1871	2,328	36.1
	1890	2,891	47.0
	1900	3,360	54.3
	1910	3,740	60.0
Communes with a population of less than 2000, rural population	1871		63.9
	1890		53.0
	1900	73,599	45.6
	1910	72,199	40.0

The figures show a remarkable decline in the percentage of rural population. Thus, while in 1871 the population of communes having 2000 or more inhabitants was 36.1 per cent of the total and that of communes having less than 2000 inhabitants was 63.9 per cent, the urban population in 1910 was 60 per cent and the rural 40 per cent. Communal population of the larger German cities, according to the 1910 census: Berlin, 2,071,257 (Greater Berlin, 3,710,000), Hamburg, 932,116, Leipzig, 626,267, Munich, 607,592; Dresden, 551,697, Cologne, 516,527, Breslau, 514,765, Frankfurt-on-the-Main, 414,576, Düsseldorf, 358,728, Nuremberg, 333,142, Charlottenburg, 305,978, Hanover, 302,375, Essen, 294,653, Chemnitz, 287,807, Stuttgart, 286,218; Magdeburg, 279,629, Bremen, 247,437, Königsberg, 245,994, Stettin, 237,419, Neukölln (formerly Rixdorf), 237,289, Duisburg, 229,483, Dortmund, 214,226; Kiel, 211,627, Mannheim, 206,049, Halle 180,843, Strassburg, 178,891, Berlin-Schöneberg, 172,823, Altona, 172,628, Danzig, 170,337, Elberfeld, 170,195, Gelsenkirchen, 169,513; Barmen, 169,214,

Posen, 156,691, Aachen (Aix-la-Chapelle), 156,143, Cassel, 153,196, Brunswick, 143,552, Bochum, 136,931, Karlsruhe, 134,313, Lichtenberg, 133,141, Krefeld, 129,406, Erfurt, 123,548, Plauen, 121,272.

Sex and Conjugal Condition—In Germany, as in most other countries not newly settled, the number of females exceeds that of males. In 1910, males numbered 32,040,166, and females 32,885,827, or 97.4 males to each 100 females, there are born about 106 boys to each 100 girls, but the number of females is in excess on account of the greater mortality and emigration among males. In 1910 unmarried males numbered 19,516,340, and females 18,591,604, married, 11,608,028 and 11,621,685, divorced, 49,122 and 83,666. In 1910 and 1911 respectively marriages numbered 496,396 and 512,819, births (including stillbirths), 1,982,836 and 1,927,039, deaths (including stillbirths), 1,103,723 and 1,187,094, excess of births, 879,113 and 739,945, living births, 1,924,778 and 1,870,720. The following table shows, for various periods and years, for each 1000 inhabitants *m* the number of marriages, *b* births (including stillbirths), *d* deaths (including stillbirths), *e* excess of births over deaths, *l* living births, and for each 100 births *i* the number of illegitimate births, *s* the number of stillbirths.

YEARS	<i>m</i>	<i>b</i>	<i>d</i>	<i>e</i>	<i>l</i>	<i>i</i>	<i>s</i>
1851-60	7.8	36.8	27.8	9.0	35.3	11.5	4.0
1861-70	8.5	38.8	28.4	10.3	37.2	11.5	4.1
1871-80	8.6	40.7	28.8	11.9	39.1	8.9	4.0
1881-90	7.8	38.2	26.5	11.7	36.8	9.3	3.7
1891-1900	8.2	37.3	23.5	13.9	36.1	9.1	3.2
1905	8.1	34.0	20.8	13.2	33.0	8.5	3.0
1907	8.1	33.2	19.0	14.2	32.3	8.7	3.0
1909	7.8	32.0	18.1	13.9	31.0	9.0	2.9
1910	7.7	30.7	17.1	13.6	29.8	9.1	2.9
1901-1910	8.0	33.9	19.7	14.3	32.9	8.6	2.0
1911	7.8	29.5	18.2	11.3	28.6	9.2	3.0

Although the average annual increase of population in 1901-10 (1.41 per cent) was greater than in the preceding decade (1.31), and although the death rate declined from 21.8 in 1901 to 17.1 in 1910, the rate of population increase in Germany appears no longer to be advancing. The movement in the death rate (and in the stillbirth rate) is similar to that of other countries where modern medical science is widely applied. The movement in the birth rate reflects a condition normal in a population tending rapidly cityward. Also, in a civilized community the birth rate shows, within certain limits, an inverse relation to the diffusion of artificial refinements. The falling birth rate, long conspicuous in France, has been, since about the beginning of the present century, very noticeable in Germany.

Emigration—Germany was long notable for her large number of emigrants. During the eighteenth century and the early part of the nineteenth Russia attracted many German emigrants, granting them various privileges, land, and pecuniary aid. During the latter century, it is estimated, more than 6,000,000 people left Germany, the majority of them for the United States. The largest emigration was in 1881, 220,902, in 1912 German emigrants numbered only 18,545. Since 1897 there has not been much fluctuation in the numbers of persons leaving the country. The total number of emigrants, the rate of emigration per thousand of the

population, and number of emigrants to the United States have been as follows

YEAR	Total No	Rate	To United States
1881	220,902	4 86	206,189
1891	120,089	2 41	113,046
1893	87,677	1 73	78,249
1895	37,498	72	32,503

Religion At the 1900 census, Evangelicals comprised about 62.5 per cent of the population, and Roman Catholics 36.1 per cent, in 1910, 61.6 and 36.7. The proportionate distribution of these bodies, which has changed but little since the religious wars of the seventeenth century, is characterized by a decided grouping within certain definite limits, corresponding to the states or to smaller political divisions, so that in most localities one or the other sect is strongly predominant. Some changes in the relative proportions of the two sects has taken place in the large cities as a result of the movement of population accompanying their recent growth. In general, central Germany is the stronghold of Evangelicalism and the Rhine and Danube regions of Roman Catholicism. More than one-third of the population of Prussia consists of Roman Catholics, who are especially numerous in Posen, Silesia, West Prussia, Westphalia, and the Rhine Province. The following table shows the religious distribution of the people according to the census of Dec 1, 1910

Lutheran and the Reformed, and the United Evangelical church (dating from 1817 and at first established only in Prussia), formed by a union of the Lutheran and Reformed bodies under state auspices. The largest Evangelical denomination outside of the Lutheran and Reformed bodies, that of the Baptists, numbers only about 30,000 members. By its latitudinarianism the Evangelical church has retained within its fold the followers of many widely different schools of thought, from extreme orthodoxy to rationalism. At the end of the nineteenth century the tendency towards rationalism in theology, which had long been so prominent in Germany, was apparently on the decline. In the last quarter of the century a considerable element of the laboring class in the large centres of population had become divorced from any church through the use of the socialistic propaganda, the defection varying in intensity from passive indifference, growing out of the belief that the church was in league with the existing political order, to a radical opposition to all religion. The Evangelical body has suffered much more severely from this movement than has the Roman Catholic, the priesthood of the latter organization having been largely successful in checking the movement through their activity in establishing Roman Catholic organizations for laboring men. The seceders from the Roman Catholic church after the Vatican Council of 1870 assumed the name of Old Catholics, and this faction now numbers about 50,000. The Roman Catholics have concentrated their forces until they have become politically the strongest party in the Empire and have consequently obtained certain advantageous concessions. The severe Prussian laws of 1873 directed against ultramontanism, by attempting

The Evangelical church in Germany contrasts with the Protestant church in America and England in that it is not split up into numerous rival factions. The adherents of the church are divided between the two confessions, the

especially to limit and to control Roman Catholic education, were repealed in 1887, and religious congregations—the Jesuits excepted—existing for charitable or contemplative purposes are allowed. The different branches of the Christian

faith are subsidized by the individual states, and in some the Jews also receive support. See REFORMATION.

Education. From almost the beginning of modern times Germany has held the primacy in educational rank. It has been distinguished both for the general diffusion of knowledge and for the superiority of its specialists in the various fields of learning. Many of the names most prominent in the pedagogical world are German. As early as 1642 Weimar had enacted a compulsory educational law, and before the middle of the century other places in Germany had followed the example. At present every child in the empire must attend school every school day in the year (usually about 42 weeks) for a period which in most German states extends from the ages of 6 to 14 years. The law is enforced to the letter, and there are scarcely any evasions. As a consequence, illiteracy has been practically eliminated.

The early movement for the improvement and extension of education was the result largely of the efforts of the Church, which had almost exclusive charge of educational matters. The first systematic educational effort dates back to the Carolingian schools attached to monasteries and cathedrals. Their methods prevailed with some modifications through the Middle Ages. By the end of the fifteenth century common schools were widespread in Germany. The ecclesiastical conflicts of the sixteenth century checked for the time educational progress, which was successfully resumed after the cessation of the religious wars. Frederick William I of Prussia established at his own expense 400 schools for the common people, and his son, Frederick the Great, was very active in furthering educational interests. For the regulation of schools he promulgated in 1763 an order that is considered the basis of the present German system. This order fixed a period for compulsory attendance, supplemented school support from the state funds, and provided for the superintendence of schools and regulations for the selection of teachers. A Law of 1794 held that all public schools and educational institutions were under the care of the state, at the same time recognizing religious instruction under the proviso that children trained in one religious faith could not be forced to take instruction in another. The educational system was revised in 1854 and again in 1872. The interest so early manifested has never been relaxed. It was estimated as early as 1840 that the pupils of Prussia numbered one-sixth of the population.

Germany has been free from the bitter religious wrangles that have characterized the educational history of France and of the United Kingdom, for it was agreed almost without question in Germany that there should be religious teaching. Schools are provided for Catholics, Protestants, and Hebrews separately, with teachers of the respective faiths, or, if conditions do not justify the establishment of separate schools, special arrangements are made separately and at the state's expense for instruction on the subject of religion. With the growth of state aid and the centralization of the school system, ecclesiastical authority has been greatly lessened, but a large per cent of the school inspectors are still the local pastors. Ecclesiastical authorities inspect the religious instruction given in the secondary schools, but their rôle is only advisory.

The educational scheme in Germany is made to conform closely to the existing social order and is strikingly different in arrangement from the American. The classification resulting from the recognition of religious differences has already been noted, but of still greater moment are the differences due to the distinction made between the sexes and to the recognition of social classes. There are, therefore, decided differentiations between schools and a disregard of coordination as the term is commonly understood in America. The line of demarcation between primary and secondary education in Germany is thoroughly well defined. It is a longitudinal differentiation established on a basis of class distinction and ultimate destination of the individual—in the last analysis determined purely by the financial standing of the parents—rather than a latitudinal differentiation, based upon age of pupils and subjects of instruction, with practical democratic ideas as a foundation, wherein lack of financial ability constitutes no insuperable barrier to the realization of individual ambition. In Germany primary and secondary schools exist side by side, the former being free schools and the latter fee schools, although for the first three years the subjects of instruction are exactly the same in both. If the financial status of the family warrants the youth in aspiring to become a member of the directing class in any field of endeavor, the decision must practically be made by the ninth year of the child's life, or the third year of the school, at the time when the secondary school proper begins. Once beyond this point, transition to the secondary school becomes practically impossible, and the elementary-school pupil is thenceforth destined to be a private, or at best an under officer in the great vocational armies, he is cut off forever from rising to a commanding position. The schools which admit to the greatest honors are thus protected by their greater cost and are therefore entirely beyond the reach of the humbler classes.

Primary Education.—The schools usually referred to as primary are known as the Volksschulen, which provide for the ordinary period of compulsory attendance. Fees were formerly charged in the primary schools, as late as 1901, 0.3 per cent of the total income of these schools being derived from this source, but to-day, save for extremely rare instances, all this instruction is free. Aside from the opportunity of transition at the end of the third or fourth year, the course here does not coordinate with the courses in the higher schools which lead to social preferment, and practically none of the pupils who complete it take up the work in the secondary schools. The only further educational provision for these children—except the few selected for normal students—are the Fortbildungsschulen, or continuation schools (part-time schools for the youth of one or both sexes, following the close of the elementary school course, and ordinarily covering the period from 14 to 17 years of age), and certain other vocational classes. The children who attend the Volksschulen are largely from the lower masses. Parallel with the Volksschulen, and doing exactly the same type of work, are the Vorschulen, or preparatory classes, attached to the regular secondary schools. By no means every secondary school has its preparatory classes, but where found they operate on a basis of class distinc-

tion and serve to separate the children of the classes from those of the masses even from the very first years of school. It is perhaps unnecessary to suggest that the *Vorschulen* are fee schools. The state supports no kindergarten schools. They are maintained through private agencies and are sometimes aided by the municipality.

Secondary Education—The secondary system is built up with little regard to the primary system. It takes its form solely with regard to the career for which it is intended to prepare, the selection forced upon parents at the end of the third year of the child's school life determining to a very large extent the ultimate career of their offspring. In the secondary-school system of earlier centuries the ancient classics held a dominant position, and an extensive system of privileges admitting to social rank had been based upon them and tended to give them a peculiar persistence. The schools in which the classics still constitute the central feature of the course are called the *Gymnasien*, and it is only by taking this course that admission may be secured to many of the highest government positions or the highest social recognition reached. But the requirements of a practical age have demanded greater and greater concessions. Changing conditions of modern society brought about a reaction against the exclusive classical basis of secondary-school culture. As early as the middle of the eighteenth century nonclassical schools (*Realschulen*), wherein modern languages, mathematics, and science formed the backbone of the course, began to come to the front. For 100 years they made slight headway, and it was not until the last half of the century just closed that these "modern" schools became relatively free for a greater development. First arose a differentiation of type, with one school teaching Latin and the other eschewing the classics altogether. In 1892 these two innovations assumed a more decided form, and since that time there have been three well-defined lines of development in boys' secondary education—the ultraclassical, represented by the *Gymnasium*, which offers both Latin and Greek, the semiclassical, represented by the *Realgymnasium*, with Latin but no Greek, and the exclusively modern, represented by the *Oberrealschule*, wherein the classical influence is entirely lacking, and in its place one finds the more realistic subjects—living languages, science, and mathematics—occupying the dominant place. The *Gymnasium* emphasizes purely humanistic culture, the *Oberrealschule* stands for exclusively "modern" studies, expressed by the very convenient German term "*Realien*", while the *Realgymnasium* is a hybrid, occupying the middle ground between the two extremes of ultrahumanism and ultrarealism. Even under such hard and fast conditions as those prevailing in Germany, definite choice of a boy's life career as early as nine years of age is exceedingly difficult. The so-called "Frankfort plan," introduced in 1892, was devised to meet the situation. This is simply a combination of the *Gymnasium* and *Realgymnasium* courses in the same school, wherein the work of the first three years of the secondary school proper is common. Thus, the family is not compelled to choose between the two courses until the boy's twelfth year, or as late as the sixth year of school. A recent modification practically makes it possible to postpone the decision until two years

later, provided the boy is willing to do a little extra work in either Latin or French, according to the new course selected. So popular has been this device to avoid too early specialization that more than a quarter of all the *Gymnasien* and *Realgymnasien* in Prussia are now organized on this basis.

Each of the three types of nine-year secondary schools has a short-course counterpart, six years in length—the *Gymnasium* having its *Progymnasium*, the *Realgymnasium*, its *Realprogymnasium*, and the *Oberrealschule*, its *Realschule*. This makes possible the extension of secondary education to communities which are not in position to support a full-course school. These six types of schools—*Gymnasium*, *Realgymnasium*, *Oberrealschule*, *Progymnasium*, *Realprogymnasium*, and *Realschule*—constitute what are known as "higher" schools, whose chief distinguishing characteristic is that the pupils are eligible for the one-year volunteer service privilege in the army. Completion of six years' work in a recognized secondary school, or passage of a special examination in the case of pupils of the non-recognized secondary schools, brings the coveted honor. Such is the social prestige attached to this privilege that parents willingly make the financial sacrifice imposed upon the volunteer of paying his entire expenses while in the army—board, lodging, clothing, and equipment—a not inconsiderable figure in the cavalry arm of the service.

Under the reform of 1901 the former dominance of the classics has been largely broken down, for now the three types of schools are theoretically upon an equality. The elaborate system of privileges previously reserved exclusively for the graduates of the *Gymnasium* has now been thrown open to the graduates of the other two types of secondary schools, i.e., the *Realgymnasium* and the *Oberrealschule*. Formerly free entrance to the university courses was restricted to the *Gymnasium* pupils. Now, in Prussia, graduates of all three schools are on practically equal footing, as far as competition for the various privileges is concerned. For the study of theology, however, the *Gymnasium* course is still exclusively required. *Oberrealschulen* graduates are also debarred from studying medicine, unless they choose to make up the required Latin by outside study. No one of the other German states is quite so liberal as Prussia. The relative importance of the different classes of secondary schools in Germany is seen in a statement of their number. In 1911, the numbers of boys' secondary schools, public and private, were as follows: 524 *Gymnasien* and 81 *Progymnasien*, 223 *Realgymnasien* and 63 *Realprogymnasien*, 411 *Realschulen* and 167 *Oberrealschulen*, and 218 "other" secondary schools (i.e., with less than the full nine-year course), almost entirely confined to the south German states. The school population was *Gymnasien*, 160,237, *Realgymnasien*, 70,357, *Oberrealschulen*, 75,832, *Progymnasien*, 9509, *Realprogymnasien*, 7252, and *Realschulen*, 89,968.

As in other continental countries, the secondary education of girls has lagged considerably behind that of boys. Thanks to the constant agitation of a group of faithful women struggling for the emancipation of their sex, the reform of 1909 placed girls' secondary schools upon a much more satisfactory basis, although the government is still loth to expend money on such an apparent luxury, for nearly half of the

girls' secondary schools in all Germany were in 1911 under private control. State regulations are issued for their administration, however, just as in the case of the boys' schools. Secondary education for girls in Prussia is provided in three types of institutions: Lyzeum, a 10-year course from 6 to 16, Oberlyzeum, with a two-year women's school course and a four-year normal school course, and university preparatory school (Studienanstalt), with a six-year course in the Gymnasium and Realgymnasium divisions and a five-year course in the Oberrealschule division, all three substantially paralleling the corresponding types among the boys' schools. Girls leave the Lyzeum at the close of the seventh year of the course to enter the Gymnasium or the Realgymnasium division, and one year later to enter the Oberrealschule division. Although girls are thus admitted freely to the universities, the final decision as to whether or not they will be admitted to a particular university class rests with the professor in charge.

Universities—Germany has 21 universities, the largest being Berlin, with 9806 pupils (winter semester, 1912-13), Munich, 6759, and Leipzig, 5351 (these figures do not include non-matriculated students). The other universities are as follows: Bonn, Breslau, Freiburg, Halle, Tübingen, Heidelberg, Göttingen, Marburg, Strassburg, Würzburg, Kiel, Königsberg, Erlangen, Giessen, Greifswald, Münster, Jena, Rostock. All legal formalities have been completed which provide for opening the University of Frankfurt on the Main in October, 1914. The universities of Freiburg, Munich, Münster, and Würzburg have Roman Catholic faculties of theology, Bonn, Breslau, Strassburg, and Tübingen have mixed Catholic and Protestant faculties, and the other universities are all Protestant. University students are allowed an extreme degree of liberty, in striking contrast to the rigid discipline observed in the secondary schools. Indeed, the spirit of freedom pervading the university life, as evidenced especially in the great liberty enjoyed by the university faculties in thought and speech, is apparently an anomaly in a government so strongly military. Further reflection, however, will show that preservation of monarchical ideals is sufficiently safeguarded by the control exercised by the Minister of Education over the appointment of university professors. Usually he designates one of the three candidates presented by the university senate, but it is quite within his power totally to disregard these suggestions and to select a candidate of his own choice. Persons holding dangerous views in any field are thus effectually eliminated. The universities are of equal rank and the entrance requirements are the same, viz., the completion of the course at a nine-year secondary school. While the universities are in theory nonrespecters of persons of social classes, they are in reality exclusive, because the expense of university life and of the secondary course preceding it tends to limit the attendance to representatives of the higher social classes.

Technical and Vocational Education—Just as the ordinary schools are classified in three large groups or degrees, so the vocational schools, most of which are under the Minister of Commerce and Industry, all fall into one of three levels—lower, middle, and higher. Under this ministry the lowest group includes the con-

tinuation schools, industrial and commercial, the middle group, the middle technical and trade schools on the one hand and the secondary commercial schools on the other, the higher group, the colleges of commerce. Largely from historical reasons, the highest of the technical group, the technical colleges, still remain under the direction of the Minister of Education, while he likewise controls some of the secondary commercial schools as well. In addition there are schools of agriculture, forestry, brewing, and the like, so that opportunity is offered for vocational training along practically every line. The lowest or continuation schools (Fortbildungsschulen) are part-time schools (compulsory in 12 of the 26 states of the Empire) for young people from 13 or 14 to 16 or 18 years of age, who have completed the elementary school and *are already at work*. They hold the youngster from four to eight hours per week (the number varying in the different states of the Empire, and the time most frequently taken from the working day), and they aim to give him simple theoretical training that shall have a direct bearing upon his occupation, but that is not designed to lift him above the position of an ordinary artisan or workman. In this same category are found the so-called mechanics' schools (Handwerkerschulen) with their out-of-work-hours classes for the improvement of journeymen. These latter schools are largely maintained by guilds and corporations. The middle technical and trade schools are of various types—engineering schools, building-construction schools, textile schools, schools for artistic trades, and simple trade schools for woodworkers, glassworkers, photographers, and the like. This group is by far the most diversified and the most difficult to classify. They differ from the schools of the lower group in that all require some practical work *already completed*, whereas the lower schools admit pupils who are carrying on their trade *pari passu*. The courses vary in length from one to three years, and the age limits range ordinarily from 18 to 25 years and over. They aim to give a kind of middle and lower training for engineers and to turn out jobmasters, second hands, and the like. Secondary commercial schools provide a kind of middle commercial training and in some cases offer courses which satisfy the requirements of the one-year volunteer certificate. The third or higher group consists of the technical colleges and the colleges of commerce. They furnish the highest type of industrial or commercial training, open the way to the highest state and private careers, and prepare the future leaders in the general fields of industry and commerce. The technical colleges are the real scientific schools of Germany, corresponding to the Massachusetts Institute of Technology and similar institutions in America. Each of these higher technical schools or technical colleges specializes in one or more of the technical professions—civil, electrical, marine, and mechanical engineering, architecture, forestry, metallurgy and mining, navigation, shipbuilding, chemistry, pharmacy, and general science. Several of these fields are treated in more elementary fashion in the schools of the middle group. The initiative for, as well as the actual work connected with, the foundation of the major part of the trade schools of Germany has come from the various trade organizations, industrial associations, or the government of the community concerned.

Some of them owe their inception to purely private beneficence. Even in the case of the ordinary continuation schools, semipublic organizations have frequently taken the initiative, and the schools have been taken over by the community subsequently, after the pioneer work has already been done. The interest of the German industrial in effecting trade-school work has not been evanescent, but it has served to keep him in close personal contact with its progress. He has not been concerned with vocational work in general, but with training for his specific business. The result has been that the schools always reflect the particular activity of the community or at least of the immediate region. Mining areas have mining schools, textile centres have textile schools, shipping localities have schools which tend to develop the maritime industries. This cooperation between school and industry, which is common alike to commercial and industrial schools, is one of the strongest and most helpful features of the German vocational-school movement. Berlin is the largest of the technical colleges, having had 2851 students (winter semester, 1912-13), but it is closely followed by Munich, with 2766. The total enrollment at the 11 colleges (Aachen, Berlin, Breslau, Brunswick, Danzig, Darmstadt, Dresden, Hanover, Karlsruhe, Munich, and Stuttgart) was 16,418. Among the colleges of commerce Cologne occupies the first place with 2542 students (winter semester, 1912-13), of whom only 555 were matriculated students. The total number of matriculated students at the six colleges (Berlin, Cologne, Frankfurt, Leipzig, Mannheim, and Munich) was 2881, although 7637 represents the total number profiting by the instruction of these schools.

School Administration—The German states act independently in their school systems. The main important outlines of the respective systems are nevertheless almost uniform. There is much variation in details. The Prussian system is generally described as representative. The control of the Prussian schools is through the Department of Education, subject to the limitations of the constitution and of precedent. The head of the department is a cabinet officer, known as the Minister of Religious and Educational Affairs. The Minister is aided by a large number of special councilors. There are two divisions for education in the department, the first having charge mainly of the universities and the secondary schools, the second of elementary education and the training of teachers. In each province there is a school board, of which the president of the province is chairman. The other members are proposed by the Minister of Education and appointed by the King. This board supervises the most general matters, such as questions concerning textbooks, etc., and especially matters concerning the secondary schools. The provinces are divided into administrative counties (*Regierungen*), and these again into districts, both the large and small divisions having school boards. These county school boards concern themselves more particularly with the common schools, although their control is decidedly general in its nature, being responsible for the execution of all school laws and of all regulations that come down from the higher authorities. Below these county boards are the local authorities—the municipal school deputation in towns and cities, and the school

committee in the rural districts. The municipal deputation may, and usually does, delegate a portion of its authority to a smaller body called the school commission, a group of individuals having charge of a single school. The municipal deputation is quite comparable to the American school board, save that it deals with the purely external affairs of the schools and their maintenance, having no control over the teachers in their professional capacity nor over the methods and processes of instruction. Such internal affairs of the school are under the absolute domination of the central authorities.

Teachers—No country is as particular as Germany in the selection and preparation of teachers. The teacher is an officer of the state and enjoys a prominent social rank. He is sure of his position for life or, after a period of service, of retirement upon a pension. However, honor is an important part of his compensation, for, especially in the primary schools, the salary is meagre and occasions much complaint. The qualifications required of teachers are about uniform in the different states, and each recognizes the certificates granted by the others. The process of selecting candidates for primary teaching begins with the children in the primary schools, only the most promising pupils being selected. On leaving the primary school the child takes a three-year course, especially designed for preparation for the normal school (seminary), where one year more of academic work and three years of normal work are demanded, the student, if needy, being financially assisted by the state. By limiting the number of preparatory schools the state can prevent the creation of any serious overplus of teachers. The feature of religious devotion is prominent in the seminaries—these being either Protestant or Roman Catholic. After finishing the seminary the candidate receives a provisional appointment and is only permanently accepted after demonstrating fitness and passing a final examination. No country in the world sets such a high standard as Germany for the qualifications of the secondary teacher. He must be a graduate of a nine-year secondary school, with at least three years of university study, one year of preparation for the state examination, one year of pedagogical study (*Seminarjahr*), and finally a year of successful practice-teaching experience. Even after having done this, and having passed all the examinations required, he is only eligible for appointment. Once on the list of the provincial school board, he is practically sure of a position, although he sometimes has to wait several years before the opportunity arrives. This all results in a degree of academic and professional preparation which is absolutely unknown in England or America.

School Funds—The method of the development of the school system has resulted in a complicated and diversified system of financial support. There are generally local taxes, which if necessary are supplemented by the state. The state fund is the largest source, supplying about one-half of the expenses, while local taxation supplies about one-fourth. The Church and Church societies are often important contributors.

Charities. The different German states, except Bavaria and Alsace-Lorraine, have adopted uniform systems of poor laws, but there is no centralized system of administration. Each poor-law district provides for its own poor, a residence of two years being the requisite time

to determine the place of settlement, although relief may be given by the local authorities of the district in which the individual has temporary residence, to be recovered from the community in which the settlement of the individual is fixed. The distinction between public and private charity is not closely drawn.

Compulsory Insurance. The Empire has played a very important part in providing for the welfare of the masses and thus checking the possibility of destitution, through the establishment of compulsory insurance against accident, sickness, and old age. None of the other leading nations has made provisions of so comprehensive a nature for the benefit of the laboring classes. Insurance against sickness, the first step taken, was first secured in 1883, followed in 1884 by the insurance against accident and in 1889 against old age. Numerous benefit societies conducting insurance features, already in existence, were recognized by the government and allowed to act as agents in lieu of those appointed by the state, which subjected all such organizations to a uniform system and control. The division of administration necessitates an increased expenditure, and an attempt has been made to centralize the entire administration of the system in the hands of the state. In the insurance against sickness two-thirds of the premium is contributed by the workmen and one-third by the employer. In the insurance against accident the employer class is responsible for the burden of contribution but the relief to the injured laboring man is taken from the sick fund for the first 13 weeks, and it is only after the expiration of that period that the employer class becomes liable. Insurance against old age is obligatory upon all laborers whose wages do not exceed 2000 marks a year. The premium paid is divided evenly between laborer and employer. The receipt of the pension begins when the insured reaches the age of 70. The amount expended in compensation in various forms under these insurance systems in 1910 was, in round figures: sick insurance, \$100,000,000; accident insurance, \$50,000,000; invalidity and old age, \$62,000,000. The pensions paid are in proportion to the wages received by the pensioner and in case of invalidity and old age range from \$40 to \$90 per annum in case of disability or reaching the age of 70. The sums paid in the accident insurance system are also based on earnings and in case of the death of the insured are paid to his widow and children at rates proportional to his earnings when employed.

History. The history of Germany may be said to begin with the year 843, when, by the Treaty of Verdun, the vast Empire of Charles the Great was divided into three parts among his grandsons. (For the earlier periods, see *GERMANIA*, *FRANKS*, *CHARLES THE GREAT*, *CAROLINGIANS*, *ETC.*) In the partition of Verdun, Louis the German (843-876) received the eastern portion of the Frankish Empire, which included the purely Germanic peoples. Until 911 legitimate or illegitimate Carolingians held the throne, but their power was comparatively little and depended almost wholly on their strength in their own possessions. Instead of a united Germany there were several great German duchies—Swabia, Bavaria, Franconia, Saxony, and sometimes Lotharingia or Lorraine. The last, however, was debatable territory, independent at first, it later was connected with its stronger neighbor, Germany or France, as the case might

be. At first the Franconians and Saxons were the strongest nations and supplied the rulers of the German Kingdom. Charles the Fat (876-887), son of Louis the German, succeeded for a brief time (884-887) in reuniting almost all the old Frankish lands under his sway, but they fell apart again after his death, and part of Germany was ruled by Arnulf till 899. The last Carolingian King, Louis the Child, died in 911, and the German princes elected as his successor Conrad of Franconia (911-918). His reign was a constant struggle to maintain his position against his own nobles, while at the same time he had to contend against Danish, Slavic, and Hungarian invaders. Just before his death he sent the insignia of royalty to his most dangerous subject, Henry the Saxon (919-936), and the latter was chosen King by the Franks and Saxons. After years of fighting and negotiations Henry the Fowler (as he was popularly known) was recognized by the Swabians and Bavarians also. Under him for the first time it is possible to speak of a united Germany. He made his power respected by repulsing the invaders who had been devastating the eastern and northern portions of the German duchies. The Slavs and Danes were defeated, Lorraine was conquered, and finally in 933, a great victory was won probably on the Unstrut, over the Hungarians. His son Otho I (936-973) succeeded to a strong kingdom. At the coronation banquet he was served by the dukes of Lorraine, Franconia, Swabia, and Bavaria. Otho restricted the power of the dukes, checked renewed invasions of the Hungarians, defeating them decisively at the Lech in 955, and organized an efficient administrative system. In 951 he was called to Italy to aid one of the contending factions there, in 961, after wresting north Italy from Berengar II, a descendant of Charles the Great, he was crowned King of the Lombards, and in 962 he received the Imperial crown at the hands of the Pope, thus becoming the founder of the Holy Roman Empire of the German nation, which existed till 1806. (See *HOLY ROMAN EMPIRE*.) By his coronation Italy and Germany became associated for long centuries to come. The results were in some ways disastrous to both countries, but at the time Otho, as Emperor, was the great power in western Europe. In order to strengthen his position, he negotiated a marriage for his son with the daughter of the Byzantine Emperor. Otho II (973-983) died at the age of 28 and left an heir of three, Otho III (983-1002). In consequence of the extent to which the Imperial power was enlisted in the affairs of Italy at this time, weakness and disunion were bred in Germany. Henry II (1002-24) left Italy to itself for some years and devoted his reign to strengthening the power of the King of Germany. He reformed the Church and employed its officials in the service of the state. He repressed private wars and won the support of the nobles by giving them greater privileges. He was the last King of the Saxon house.

Conrad the Franconian, or Sahian (1024-39), was an able ruler, who added the Arletan realm (see *BURGUNDY*) to the Empire. His son and successor, Henry III (1039-56), extended the boundaries of Germany on the side of Hungary, repressed the insolence and despotism of the temporal and spiritual princes of Germany, and gained the respect of his contemporaries by his zeal for justice and his valor in the field. The

minority of his son and successor, Henry IV (1056-1106), enabled the nobles to recover much of their former power and to apply a check to the further consolidation of the Imperial authority, which had been considerably extended during the two preceding reigns. Henry's constant quarrels with Pope Gregory VII and the succeeding popes entangled him in difficulties and mortifications which ended only with his life, and which plunged Germany into anarchy and disorder (See *INVESTITURE*). With his son and successor, Henry V (1106-25), the male line of the Franconian dynasty became extinct, and after the crown had been worn (1125-37) by Lothair of Saxony, Conrad III, Duke of Franconia, inaugurated the Hohenstaufen dynasty. His reign (1138-52), in which the civil wars of the Guelphs and Glubellines (q.v.) began, was distracted by the dissensions of the great feudatories of the Empire, while the strength of Germany was wasted in the disastrous Second Crusade, in which Conrad took an active part. Frederick I (1152-90), surnamed Barbarossa, Duke of Swabia, was, at the recommendation of his uncle, Conrad, chosen his successor, and the splendor of his reign fully warranted the selection. By the force of his character Frederick acquired an influence over the diets which had not been possessed by any of his immediate predecessors, and during his reign many important changes were effected in the mutual relations of the great duchies and principalities of Germany, while we now for the first time hear of the hereditary right possessed by certain princes to exercise the privilege of electing the Emperor (See *ELECTORS, GERMAN IMPERIAL*). Unfortunately for Germany, this great monarch suffered his desire to uphold the Imperial authority in Italy to draw him away from the interests of his own country, while his participation in the Crusades, in which he perished, was memorable only for the misfortunes which it entailed on the Empire. The interval between the death of Frederick Barbarossa (1190) and the accession of Rudolph I (1273), the first Emperor of the Hapsburg line, was one of constant struggle, internal dissension, and foreign wars. Individually the princes of the Hohenstaufen dynasty were popular monarchs, distinguished for their many noble and chivalrous qualities, while one of the race, Frederick II, was, after Charles the Great, perhaps the most remarkable sovereign of the Middle Ages, but their ambitious designs on Italy, and their constant but futile struggles with the papal power, were a source of misery to Germany. The territory in which the Holy Roman emperors of the time of Hohenstaufen exercised their sway, or their overlordship, reached on the west to the rivers Rhone, Saône, Meuse, and Scheldt (thus embracing a large strip of modern France, Belgium, and the Netherlands), and extended on the east to the borders of Hungary and Poland, including most of what is now Cisleithan Austria. On the north it extended as far as the Eider, and in the south nominal limits of the Empire reached down into Italy beyond Rome. Henry VI (1190-97), son of Frederick Barbarossa, attempted to make the Imperial dignity hereditary in his family. After his death Philip of Swabia (1198-1208) and Otho IV of Brunswick contended for the Imperial throne, the latter being recognized on the assassination of his rival by Otho of Wittelsbach. With Frederick II (1215-50), the suc-

cessor of Otho IV, ended the glory of the Empire, till it was partially revived by the house of Hapsburg. Frederick's son, Conrad IV (1250-54), the last of the Hohenstaufen (q.v.), after a brief and troubled reign, was succeeded by various princes, who in turn, or in some cases contemporaneously (the Great Interregnum, so called), bore the Imperial title without exercising its legitimate functions or authority—William of Holland (1247-56), Alfonso the Wise of Castile (1257-62), Richard of Cornwall (1257-72). This season of anarchy was terminated at the accession of Rudolph I (1273-91), of the house of Hapsburg, who, by the destruction of the strongholds of the nobles and the stringent enforcement of the laws, restored order. His chief efforts were, however, directed to the aggrandizement of his house. In 1276 he vanquished Ottokar II of Bohemia and forced him to give up Austria, Styria, Carinthia, and Carniola. Ottokar, having renewed the struggle, was defeated and slain on the Marchfeld in 1278 (See *AUSTRIA-HUNGARY*). For the next 200 years the history of the Holy Roman Empire presents very few features of interest and may be briefly passed over. Adolphus of Nassau, who was elected to succeed Rudolph (1292), was attacked in 1298 by the son of the latter, Albert I of Austria, who coveted the Imperial throne, and the war speedily ended in the triumph of Albert. The reign of this Prince (1298-1308) is chiefly memorable as the period in which the three Swiss cantons of Unterwalden, Schwyz, and Uri were achieving their independence, in 1309 they were recognized as immediate vassals of the Emperor. After the murder of Albert the throne was occupied in rapid succession by Henry VII (1308-13), of the house of Luxemburg (whose dynasty ruled for a century in Bohemia), and by the rival emperors Frederick of Austria (1314-22) and Louis the Bavarian (1314-47). Charles IV (1347-78), the successor of Louis, of the house of Luxemburg, was the successful candidate among seven rivals. Although he was engrossed by the interests of his hereditary possession of Bohemia, he did not entirely neglect those of the Empire, for which he provided by a written constitution known as the Golden Bull (q.v.), issued in 1356, which regulated the rights, privileges, and duties of the Imperial electors and the mode of election and coronation of the emperors. The seven princes designated in the Golden Bull as Imperial electors were the archbishops of Mainz, Treves, and Cologne, the Duke of Saxony-Wittenberg, the Margrave of Brandenburg, the Count Palatine of the Rhine, and the King of Bohemia. Charles's son Wenzel, or Wenceslas (1378-1400), who was finally deposed, brought the royal authority into contempt, from which it was scarcely redeemed by Rupert of the Palatinate (1400-10). The reign of Sigismund (1410-37), the brother of Wenceslas, is noteworthy in connection with the councils of Constance and Basel and the Hussite wars. With Sigismund the Luxemburg line of emperors terminated. In the person of Albert II of Austria (1438-39), the house of Hapsburg once more secured possession of the Imperial throne, which, with slight interruption, was occupied by them to the end, although the crown remained elective. After a brief reign, in which he gave evidence of capacity for governing, Albert was succeeded by his cousin, Frederick III (1440-93), an accomplished but

avaricious and indolent prince, whose chief object seems to have been the aggrandizement of the house of Austria.

Aspirations towards national unity had appeared before this among the people of Germany, but they ran counter to the spirit of feudal anarchy, and to the family policy of the Hapsburgs, who became by their marriage alliances more and more involved in general European affairs and less interested in those of Germany. The emperors could not be made, therefore, the leaders of a national movement which sought rather to realize itself, first through the Diet, and then in alliance with the Lutheran Reformation (See REFORMATION). Upon this conflict, and upon the religious differences which grew out of the work of Martin Luther and John Calvin, the politics of the empire turned for 150 years. These tendencies developed under Maximilian I (1493-1519), during whose reign an active agitation was carried on in the Diet for reform (see AULIC COUNCIL, IMPERIAL CHAMBER), while Luther's bold challenge in 1517 set into play giant forces of change which were destined to shape German history for the future. At the same time the marriages of Maximilian drew the Hapsburgs more than ever into interests outside of Germany. The first of these marriages, with Mary, heiress of Charles the Bold of Burgundy (1477), added to the Hapsburg possessions the great Burgundian territories in the Low Countries, the second, with the daughter of Ludovico il Moro, Duke of Milan (1494), threw the Imperial house into the stormy politics of Italy. The marriage of the son of the Emperor, the Archduke Philip, with Joanna of Spain made that country, then at the summit of its prosperity and power, likewise a Hapsburg possession in the person of Maximilian's grandson, Charles I of Spain, who was elected Emperor in 1519 as Charles V (1519-56). The energies of Charles were mainly directed to the prosecution of the war against France. The Austrian possessions of the house of Hapsburg were bestowed on his brother Ferdinand (from whom the present German-Magyar-Slav monarchy of Austria-Hungary may be said to date), the control of affairs in Germany was left largely in the hands of the Imperial chambers, the pressing need for reform received little attention, and the spread of the Reformation was allowed to continue unchecked. Luther, it is true, was placed under the ban of the Empire in 1521, but at Speier, in 1526, the Reformers gained a notable triumph, and it was not until the Diet of Augsburg, in 1530, that the Protestants and the Emperor came to an open breach. Danger from the French King and from the Turks, however, prevented Charles from taking action against the recusant princes, and for some 10 years after 1531 the Schmalkaldic League (qv) of Protestant princes exercised a preponderating influence in German affairs. Only in 1546 did the Emperor find an opportunity for turning on the Protestants, the power of the Schmalkaldic League was broken in the battle of Muhlberg (1547), and the Protestant leaders, John Frederick, Elector of Saxony, and Philip, Landgrave of Hesse, were made prisoners. Charles was now supreme in Germany, and it seemed for a moment as if he would succeed in winning back the Protestants into the Roman Catholic fold (See INTERIM, *Augsburg Interim*). But jealousy of his growing power caused Maurice of Saxony, Albert,

Duke of Mecklenburg, the Margrave of Brandenburg, and William, the son of Philip of Hesse, to league against him in alliance with the French King, Henry II, who in 1552 wrested from the Empire the bishoprics of Metz, Toul, and Verdun. The Treaty of Passau (qv), concluded in the same year, confirmed by the Peace of Augsburg in 1555, granted to the Lutheran states the right to establish the Protestant worship. Broken by the uniform ill success of his policy, Charles laid down the government of the Netherlands in 1555, and in the following year abdicated the Spanish and Imperial thrones, being succeeded in the empire by his brother, Ferdinand I (1556-64). The reigns of Ferdinand and Maximilian II (1564-76) witnessed the very rapid growth of the Counter Reformation (qv). Profiting by the dissensions prevailing among the Protestants, Roman Catholicism, issuing in renewed vigor from the Council of Trent (1545-63), boldly challenged the progress of the Reformed religion. Rudolph II (1576-1612) was under the influence of the Jesuits and lent himself to the aggressive policy of the Roman Catholic party. In 1608 the Evangelical Union was organized under the leadership of the Elector Palatine, and this was followed by the foundation of the Roman Catholic League in the following year. Matthias (1612-19) was less aggressive than his predecessor, but weak, and let himself be guided by the extreme faction of the Roman Catholic party. The choice of his cousin Ferdinand, a bitter enemy of the Protestants, to be King of Bohemia, in 1617, was the signal for the outbreak of a struggle that had long been seen to be inevitable. See THIRTY YEARS' WAR.

The Thirty Years' War (1618-48), which was terminated in the reign of Ferdinand III (1637-57), left the rural districts of Germany almost depopulated, its trade and industries crippled, the people burdened with taxes, and the Imperial power weakened by the concessions made in the Peace of Westphalia to the autonomy of the individual states. Austria came to be regarded by the German nationalists as a foreign power, and the recognition of the Lutherans and Calvinists as factors in the Empire broke down the religious unity on which the mediæval Empire rested. Already, under Henry IV, France had adopted an anti-Hapsburg policy, rightly regarding that house, with its vast possessions, as the chief rival of France in European affairs. Richelieu (qv) carried on this policy vigorously during the Thirty Years' War, in assisting the Swedes and the Protestant princes against the Imperialists, and the French arms had a great share in forcing the Roman Catholic powers to terms of peace. When the growth of the power of France in the seventeenth and eighteenth centuries threatened the balance of power in Europe, the Hapsburgs were naturally drawn into the coalition against France. (See LOUIS XIV, SUCCESSION WARS, *War of the Spanish Succession*). The Imperialist forces under Prince Eugene of Savoy shared in the victories which put an end to the aggressions of Louis XIV, but the empire derived no substantial advantage, except in the limitation that was put upon the growth of French predominance. The emperors during this period were Leopold I (1658-1705), Joseph I (1705-11), and Charles VI (1711-40).

The rise of Prussia now becomes one of the most striking features in German affairs. Since

the time of the Great Elector, Frederick William (1640-88), the Margraviate of Brandenburg had been acquiring increased importance as a leading power among the Protestant German states. In 1701 the Elector Frederick assumed the title of King in Prussia and was so recognized by his overlord, the Emperor of the Holy Roman Empire. Thus, while still a vassal of the Emperor, he took rank by virtue of his royal title with the other independent sovereigns of Europe. Prussia, by reason of its rapidly increasing power, its Protestantism, and the energy infused into its administration, came to be the exponent of the German national spirit and of the enmity to Hapsburg domination. Frederick the Great (1740-86) was the mighty representative of this idea. The long effort of the Emperor Charles VI to secure the guaranty of the European states for the Pragmatic Sanction (qv), which was intended to secure the unquestioned succession of his daughter Maria Theresa in the Hapsburg dominions, did not prevent an active contest which involved Europe in war (1740-48). (See SUCCESSION WARS, *War of the Austrian Succession*.) Austria was stripped of the greater part of Silesia by Frederick the Great. After an interregnum Charles Albert, Elector of Bavaria, was raised to the Imperial throne as Charles VII in 1742. This was the first time in 300 years that the iron crown rested upon a non-Hapsburg head. Charles died in 1745 in the midst of his unsuccessful war with Austria, and the husband of Maria Theresa, Francis Stephen, of the house of Lorraine, was elected his successor, assuming the title of Francis I. The peace which followed the War of the Austrian Succession was of brief duration. In 1756 Maria Theresa renewed the struggle with Prussia in order to recover Silesia. The historical hostility between England and France and between Austria and Prussia developed into a general European war, in which, by a sudden change of alliances (called the diplomatic revolution), Austria and France, with Russia, were ranged against England and Prussia. (See SEVEN YEARS' WAR.) Prussia came out of this bloody struggle with enhanced prestige, a recognized military power of the first rank in Europe. The well-meant but injudiciously applied reforms of the Emperor Joseph II (1765-90) did not strengthen the incongruous Austrian state, and his attempts to restore the declining Imperial authority in Germany were frustrated by Prussia.

The French Revolution disturbed all previous adjustments. Austria, under the Emperor Leopold II (1790-92) and his successor the Emperor Francis II, and Prussia, under Frederick William II (1786-97), were for a time united in resistance to the revolutionary propaganda which threatened the thrones of Europe, but were defeated by the French armies. The advent of Napoleon played havoc with the Germanic system. He succeeded in partially isolating Austria and Prussia, by inducing many of the west German princes to form the Confederation of the Rhine and ally themselves with France (1806). The only ally who supported him through his entire period of success and misfortune was the King of Saxony. Francis II in 1806 laid down the title of Holy Roman Emperor, having previously assumed that of Emperor of Austria, which was symbolic of the actual breaking up of the old order and the

preparation for a new Germany. When Napoleon had been overthrown, it was found, in spite of the policy of conservative reaction, to be neither possible nor desirable to restore the old system. The more than 300 semi-independent states which had existed in the eighteenth century had been consolidated by Napoleon into 39 (see MEDIAEVA), a fact which was of much service in promoting German unity. Prussia, which had been dismembered by Napoleon and trodden underfoot, emerged from the War of Liberation rejuvenated by the patriotism of its people and strengthened by thoroughgoing reforms and was prepared again to dispute precedence with Austria in the Germanic body. Stein, Scharnhorst, Fichte, and Schleiermacher will always be remembered for the constructive ability and foresight they displayed during this period. It was manifestly impossible to restore the old Imperial arrangements, which had become worthless long before they were cast aside. The Congress of Vienna (see VIENNA, CONGRESS OF), therefore, in 1815 instituted a Germanic Confederation under the guaranty of the European Powers. There was to be a federal diet, in which Austria was to have the presidency. There was no national army or financial system. The executive consisted in making one division coerce another if it refused to carry out the laws.

All of the German states were now disturbed by agitations for constitutional government, which were fought inch by inch by many of the princes. The dominant spirit among the rulers was that of reaction, and the control of affairs was largely in the hands of the astute Austrian Chancellor, Prince Metternich (qv). Three parties represented the contending ideas of government held in Germany after the Restoration—the absolutists, among whom were found most of the reigning families, including those of Austria and Prussia, the party of historic rights, who had no faith in constitutions, but stood on the traditional customs of the German people, such as the assemblies of estates, and the constitutionalists, liberal and more or less democratic, strongest in south Germany, where the French influence had been most felt. This liberalism was especially fostered among the students in the universities (see BURSCHENSCHAFT) and was closely connected with the spirit of nationalism, which was rapidly gaining strength, although for a time it was kept within limited bounds by the governments. The chief obstacle to national unity was now, as it had always been, the obstinacy with which the princes clung to their feudal status and to the independence which had grown therefrom. The problem had been made simpler by the Napoleonic consolidations, but the princes who remained were made stronger by the same means. Only the leadership of some state that should be willing to represent the aspirations of the people and strong enough to coerce resisting states could accomplish what the nationalists sought. This rôle was reserved for Prussia. The revolutionary agitation of 1830 was felt in Germany and gave some impulse to the constitutional movement, strengthened by the establishment of the Zollverein (qv), or customs union, due to the initiative of Prussia, but it was not until the more stirring year of 1848 that the forces of discontent and progress that had been at work in spite of Metternich's repressive policy really showed themselves in their strength. On March 13 Metternich was driven from power. (See

AUSTRIA-HUNGARY) A few days later a successful popular rising took place in Berlin, and at the same time Louis I of Bavaria was compelled to abdicate. In April there was a republican insurrection in Baden, which, however, was speedily suppressed. In response to the demand for a national parliament, such a body was assembled at Frankfurt (May 18, 1848, to May 13, 1849) (See VORPARLAMENT). A provisional national government was organized under an Imperial administrator, the Archduke John of Austria. The Parliament, however, was divided into factions, and a struggle between the Austrian and Prussian parties ensued. Austria sought to bring its whole Empire into the new organization, with a preponderating voice in affairs, which would have made the new Empire non-German. Prussia and the German nationalists objected and finally carried the day, choosing the King of Prussia to be Emperor of the Germans (1849). Frederick William IV was not equal to the great opportunity, and he rejected the proffered crown because it came from the people and not from his peers, the German princes. However, after signing treaties with Saxony and Hanover, the King granted a constitution which was similar to the one proposed at Frankfurt. The desertion of the national cause by Prussia was followed by insurrections in the Palatinate, Saxony, and Baden, which were rigorously put down, mainly by the arms of Prussia, and the opportunity for the erection of a German nation went by until it should be recreated by the "blood and iron" policy of Bismarck (q.v.). The national Parliament having gone to pieces, Austria and Prussia united in 1850 to restore the old diet. The two powers now proceeded to establish the old order in the duchies of Schleswig and Holstein, which had risen in revolt against Denmark. Prussia assumed the leadership in proposing plans for reorganizing the Germanic body, but could not harmonize its own ambitions with those of Austria. In 1858 Prince William became Regent of Prussia and in 1861 succeeded his brother as William I. Imbued with the conservative spirit of the Hohenzollerns, but possessed of much sound sense, courage, and patriotism, he met the existing situation in a different spirit from that of his weak predecessor. Bismarck early became his chief minister and remained at his side until his death. The latter saw the futility of all efforts at German organization that had been previously made and determined that the only way to the attainment of the great object was for Prussia to force a direct issue with Austria and fight it out as the champion of German nationality. He held to the doctrine that sovereignty could not be exercised by two states over any one district. The opportunity was found in the troubled affairs of Schleswig-Holstein (q.v.). By the Convention of Gastein (Aug. 14, 1865) Austria and Prussia arranged a joint occupation of the duchies, against the wishes of the smaller states represented in the diet. In this common administration, although the sphere of each power was defined, there was ample opportunity for the outbreak of the old rivalry. Austria sought to force the hand of Prussia by referring the settlement of the Schleswig-Holstein question to the Federal Diet. Prussia met this move by sending its forces into Holstein, which had been under Austrian occupation. The Diet ordered the mobilization of the Federal forces (June 14, 1866). Prussia

at once began hostilities, having previously formed an alliance with Italy against Austria (See SEVEN WEEKS' WAR). Prussia's preparedness was shown by her prompt action in each detail. She ordered Hanover, Hesse-Cassel, and Saxony, which had adhered to Austria, to disarm and at once invaded their territories. The Saxon army retired through Bohemia, to effect a junction with the Austrians, the Hanoverians laid down their arms after a useless show of resistance, and the Prussians, having secured their base, declared war against Austria and invaded Bohemia in three columns. In the vigorous seven weeks' campaign, whose brief duration has given its popular name to the war, Austria met a succession of defeats, culminating in the overwhelming one of Königgratz (July 3). By the Peace of Prague (Aug. 23, 1866) the dissolution of the old confederation was consummated. Austria ceased to be a member of the Germanic body, and Schleswig-Holstein, Hanover, Electoral Hesse, Nassau, and Frankfurt were incorporated with Prussia, which negotiated separate treaties with Baden, Bavaria, the Grand Duchy of Hesse, Saxony, and Württemberg.

The North German Confederation was now constituted under Prussian leadership. Bavaria, Württemberg, and Baden allied themselves with the new body, though they did not enter it. Their treaties with Prussia provided for an offensive and defensive alliance, and acceptance of Prussian leadership in case of war. The Constituent Diet of the new confederation met Feb. 24, 1867, and proceeded to frame a constitution which forms the basis of that of the present Empire. The aspirations of Prussia looked to the completion of German unity by the addition of the south German states and the establishment of the paramount influence of the new German state in European affairs. Bismarck was well aware that the consolidation of Germany meant eventual war with Germany's ancient enemy (France), and he prepared for it as thoroughly as he had for the conflict with Austria. War was narrowly averted in 1867, when France sought to occupy Luxemburg as a compensation for the territorial acquisitions of Prussia, and in 1869, when France showed unequivocally her desire to annex Belgium. The intention of Spain to seat a Hohenzollern prince on the vacant throne offered an opportunity for the quarrel which France was now seeking, and the injudicious conduct of Benedetti, the French Minister at Berlin, combined with the fatuous insistence of the French Foreign Minister, Gramont, upon an impossible apology from King William, and the unscrupulous suppression by Bismarck of a pacific section of King William's reply thereto, started a feeling in both countries that could only result in war, which was declared by France, July 19, 1870. The French expected to invade Germany, win over the south German states, and march straight on Berlin. Instead they found the German army mobilized on the frontier, and the south German states loyal to their alliance. A quick succession of German victories was followed by the surrender of MacMahon's army and the capture of Napoleon himself at Sedan (Sept. 2, 1870), the investment of Paris, and the capitulation of Bazaine at Metz (October 27). While the united armies of Germany were still besieging Paris, King William, at Versailles, received from the people of Germany, in pursuance of

the decree of the North German Diet of Dec 10, 1870, the title of German Emperor, hereditary in the Prussian dynasty (Jan 18, 1871). On the 16th of April the constitution of the Empire, which was substantially that of the North German Confederation, with the addition of certain special provisions for the south German states, was promulgated. By the treaty of peace with France, signed on the 10th day of May, at Frankfort on the Main, Germany received the provinces of Alsace, with the exception of Belfort, and the German-speaking part of Lorraine, including Metz and Thionville, and an indemnity of five milliards of francs (\$1,000,000,000). See FRANCO-GERMAN WAR.

The southern states had all entered the new Empire. The military preponderance of France on the continent of Europe was at an end. Secure in its position as a dominant power, the new Germany was free to develop its national genius. But Bismarck's internal policy during the first years of the Empire was not as successful as his state-building process had been. He became involved in a conflict with the Roman church, and this became the leading issue in Imperial politics for six years, from 1873 to 1879. (See KULTURKAMPF.) The preponderant position of Germany in the affairs of Europe was asserted at the time of the Russo-Turkish War (1877-78), when the Congress of Berlin was convened for the settlement of the Eastern Question and German diplomacy prevented Russia from making extensive territorial gains in the Balkans. After the attempts upon the life of the Emperor in 1878, falsely attributed to Socialist teachings, all Socialistic agitation was prohibited, while, to win over the reform sentiment, the government undertook legislation for the benefit of the working classes, such as compulsory state insurance. An extensive system of canals was begun in 1886, including the great Kaiser Wilhelm Canal, connecting the North Sea and the Baltic, which was opened June 19, 1895. As soon as Austria had been expelled from the Germanic body it became Bismarck's policy to cultivate friendly relations with that country, as Germany's closest neighbor and kin, and in 1883 the Triple Alliance (qv), comprising Austria, Germany, and Italy, was formed, with the object of maintaining the balance against France and Russia. With an expanding commerce and firmly believing in the doctrine that "trade follows the flag," in 1884 Germany embarked upon her career as a colonizing power. (See GERMAN EAST AFRICA; GERMAN SOUTHWEST AFRICA, KAMERUN.) Emperor William I died in 1888 and was succeeded by his son, Frederick III, a man of liberal tendencies, but who was then suffering from cancer of the throat, dying in a few months. He was succeeded by his son, William II. Differences very early developed between the Kaiser and the great Chancellor, and an issue having been made on the question of the renewal of repressive measures towards the Socialists, Bismarck was ordered to resign, and his resignation was accepted March 20, 1890. He was succeeded by General von Caprivi (qv). The Emperor himself, irritated by the failure of his plan for an international labor conference, became a bitter opponent of the Socialists. After 1879 Germany maintained a protective tariff, and duties were considerably increased in several directions, though the operation of the fixed tariff was much modified by tariffs based upon reciprocity

treaties. The development of German industry and commerce checked the stream of emigration, and the population has continued to increase. Caprivi retired from the chancellorship in 1894, giving place to Prince Hohenlohe. In the following years the government gave particular attention to the development of a powerful navy to keep pace with the rapid growth of foreign commerce. William II actively promoted the development of an aggressive colonial policy in various parts of the world. In 1898 he seized the pretext of the murder of two German missionaries in China to exact from that country the cession of the port of Tsing-tao in the Kiaochow peninsula and 50 square miles of adjacent territory, and to establish a sphere of influence in Shan-tung, one of the richest Chinese provinces. He then attempted, following the Boxer movement, to claim for Germany a predominant rôle in the Far East. (See CHINA.) Prince Hohenlohe resigned the chancellorship in 1900, partly because of disagreement with the Emperor's Chinese policy, and was succeeded by Count, later Prince, von Bulow. Economic questions were in the foreground during the next five years. A new tariff law was enacted in December, 1902, greatly increasing the duties on foreign food products in accordance with the demands of the Agrarian element. The bill was opposed by the Social Democrats, who characterized the measure as an act legalizing "bread usury." The Reichstag elections of June, 1903, were fought out on the tariff issue and resulted in a signal triumph for the Social Democrats, who increased their representation in the Reichstag from 56 to 81, taking second place after the party of the Centre. Their popular vote rose from 2,107,000 to 3,010,000 as against 1,875,000 votes cast by the Centre. The Agrarians, on the other hand, met with severe reverses. To secure the support of the Roman Catholic Centre the government in March, 1904, amended the anti-Jesuit law so as to permit members of the Society of Jesus to take up their residence anywhere in the Empire. The keynote to German foreign policy during this period was a growing estrangement from Great Britain, which had its ultimate reason in commercial rivalry and was fostered by the indiscreet conduct of the Emperor at the critical period preceding the outbreak of the South African War, and the violent anti-British tone of the German press during the progress of that struggle. In the Russo-Japanese War the German government maintained an attitude of benevolent neutrality towards Russia, but viewing with alarm the growing friendship between France and Great Britain, it took advantage of Russian disaster in the Far East to test the strength of the Anglo-French understanding by antagonizing the policy of France in Morocco. (See FRANCE, MOROCCO.) During the early months of 1905 war with France seemed imminent, but the Anglo-French agreement held fast, as was shown in the international conference which met at Algiciras in 1906. By this treaty France, together with Spain, was given a protectorate over Morocco. In 1904 an uprising broke out in German Southwest Africa (qv). It lasted over two years, and was suppressed with difficulty. Believing that the colonial policy was a failure, the Reichstag refused to vote an extra appropriation for colonial purposes and was dissolved in 1906. In the elections of the following year the Kaiser's policy of Imperial

expansion was decisively affirmed by the people. The Socialist representation was reduced from 81 to 43 seats, though their popular vote showed an increase. Austria's formal annexation of Bosnia and Herzegovina (qv) in 1908 (provinces of the Ottoman Empire first occupied in 1878) caused warlike preparations to be made by Serbia and Russia, but the announcement that Germany would support her ally prevented hostilities from occurring and enabled Austria to maintain her action in the two provinces and to prevent an extension of the Serbian railroad system to the Adriatic. The Conservative and landed interests predominated in the Reichstag, and the necessity of raising additional revenue to meet the increasing military expenditures was met by taxes levied chiefly on consumption and but slightly on property and income. Von Bulow, together with the Left, which for once cooperated with the government, was opposed to this plan, and because of his defeat by the Reichstag Von Bulow resigned and Von Bethmann-Hollweg was appointed Chancellor in his stead. The question of electoral reform came up in Prussia during the year 1910, and the ministry succeeded in passing a bill perpetuating the three-class system, whereby 85 per cent of the voting population elect only one-third of the members of the Prussian Lower House, the Landtag. By a treaty in 1911 Russia and Germany came to an amiable agreement as to their rights in the Near East—Germany's sphere of influence to continue along the Bagdad Railway, while Russia's supremacy in northern Persia and Kurdistan was acknowledged. It was in the same year that Germany became embroiled in another controversy with France over the question of Morocco. England supported France and compelled Germany to acknowledge the supremacy of French claims in Morocco, but in return France ceded to Germany 112,000 square miles in the French Congo.

The year 1912 marked the election of another Reichstag. A determined effort was made on the part of the Left, consisting of the Social Democrats, Liberals, and Radicals, to break the "blue-black bloc," which was composed of the Agrarians, Catholic Centre, and Conservatives. The policy of the latter group as represented by the Chancellor was a combination of an aggressive foreign policy with a domestic system of protection to the landed and propertied classes. Despite the efforts of the Kaiser, who declared the Social Democrats to be enemies to the Empire, the Left made sweeping gains. The popular vote of the Social Democratic party increased to 4,238,000, and their representation in the Reichstag totaled 110 seats. The precarious majority of the government in the Reichstag was threatened when the Centre refused to cooperate with the Chancellor because of the refusal of the Bundesrat to remove the Jesuit disabilities of 1872. The Bundesrat gave way, and the Centre returned to the support of the government. The rapid increase in the cost of the war armament necessitated the levying of a special tax which was assessed on property values and by a cumulative tax on incomes. The disturbances at Zabern in 1913 provoked a storm of criticism of the military system of the Empire, which, when coupled with the significance of the Krupp exposures of that year, showed the strong dissatisfaction of a large class with the militaristic organization of the country.

The industrial development of Germany since the founding of the Empire has been one of tremendous economic growth. The discovery of stores of coal and iron, the development of an efficient system of industrial education coupled with the encouragement given by the government to industry, have all been factors in the transition of Germany from a country of agriculturists to a nation that is chiefly characterized by manufacturing and by commerce.

The political problems that exist are in a large measure due to the failure to readjust the political system to the changed economic life. Representation in the Reichstag is still based on the apportionment made in accordance with the population of 1871, since when the cities have greatly increased in population, while the rural districts have declined. As a result, there is a demand for reapportionment on the part of the Social Democrats, whose chief strength lies in the underrepresented cities. This, together with the three-class system of public voting in Prussia, and the proposition to make the Chancellor responsible to the Reichstag, forms the chief political topic of the day.

The foreign policies of Germany have been greatly affected by the creation of the Triple Entente of Russia, England, and France, and she has expended vast sums of money for the building of a fleet and the maintenance of an army. Indeed the efforts of Germany, as the head of the Triple Alliance (qv), to become the first power of Europe have probably been the immediate cause of the race for armaments which is so characteristic of Europe at the present time. See *POLITICAL PARTIES, Germany*. For a detailed account of the operations of Germany in the European War of 1914 see the article *WAR IN EUROPE*.

HISTORY For a brief treatment of German history, consult Henderson, *A Short History of Germany* (New York, 1908), a product of modern critical scholarship. Bryce, *The Holy Roman Empire* (ib., 1892), is a luminous essay that must be studied to understand the political development of Germany and its relations with the Holy Roman Empire. One of the best guides is *Quellenkunde der deutschen Geschichte*, ed by Dahlmann-Waitz-Heire (Leipzig, 1912). For general history, consult the *Bibliothek deutscher Geschichte*, by Gutschke and 12 others (Stuttgart, 1876 et seq.), excellent. Lamprecht, *Deutsche Geschichte* (12 vols., Berlin, 1891-1909), Gebhardt, *Handbuch der deutschen Geschichte* (2 vols., Stuttgart, 1910), Nitzsch, *Geschichte des deutschen Volkes bis zum Augsburger Religionsfrieden* (3 vols., Leipzig, 1892), Janssen, *History of the German People*, trans by Christie (London, 1907). The history of Germany in mediæval times is adequately treated by Henderson, *History of Germany in the Middle Ages* (New York, 1894), Fisher, *Mediæval Empire* (2 vols., London, 1898), Stubbs, *Germany in the Early Middle Ages* (New York, 1908), id., *Germany in the Later Middle Ages* (ib., 1908). The following are standard works by some of the foremost of German historians on the modern period. Marcks, *Germany and England. Their Relations in the Great Crises of European History, 1500-1900*, trans (London, 1900), Treitschke, *Deutsche Geschichte im neunzehnten Jahrhundert* (Leipzig, 1879-94), Oncken, *Das Zeitalter der Revolution, des Kaiserreiches und der Befreiungskriege* (Berlin, 1890-92), Bulle, *Geschichte der neuesten Zeit, 1815-71* (Leipzig, 1886-87), Erdmannsdörffer, *Deutsche Geschichte vom westphälischen Frieden bis zum Regierungsantritt Friedrichs des Grossen, 1648-1740* (Berlin, 1892-94), Blum, *Das deutsche Reich zur Zeit Bismarck* (Leipzig, 1893). Useful available books in English are Malletson, *The Re-founding of the German Empire, 1848-71* (London, 1893), Muller, *Political History of Recent Times, 1816-75* (New York, 1892), translated and brought down to 1881 by Peters, and written with special reference to Germany, Murdock, *The Reconstruction of Europe* (Boston, 1889), Baring-Gould, *Germany, Past and Present* (London, 1881), Eltzbacher, *Modern Germany* (ib., 1905), Ashley, *Modern Tariff History* (ib., 1904), Andrews, *Contemporary Europe, Asia, and Africa* (Philadelphia, 1902), Cambridge *Modern History*, vols x, xi, xii (New York, 1903-12), Schierbrand, *Germany. The Welding of a World Power* (ib., 1907), Perris, *Germany and the German Emperor* (London, 1912), Bernhardi, *Germany and the Next War* (ib., 1912), Dove, *Die deutschen Kolonien* (4 vols., Leipzig, 1909-13), Roberts, *Monarchical Socialism in Germany* (New York, 1913), Hurd and Castle, *The German Sea Power* (London, 1913). For German diplomacy and government, consult Debidour, *Histoire diplomatique de l'Europe, 1814-78*, vols 1 and 11 (Paris, 1891), Lowell, *Governments and Politics in Continental Europe* (New York, 1896), Howard, *The German Empire* (ib., 1906), Denis, *La fondation de l'empire allemand* (Paris, 1906), Headlam, *Bismarck and the Foundation of the German Empire* (New York, 1908), Von Bulow, *Imperial Germany* (ib., 1914), Hobbs, *The World War and its Consequences* (New York, 1919); Berger, *Germany After the Armistice* (New York, 1920), Young, *New Germany* (New York, 1920), Clap-

ham, *Economic Development of France and Germany* (New York, 1921) For detailed references on German history, consult the bibliographies of Lavisse and Rambaud, *Histoire générale* (Paris, 1893-1900), Seignobos, *Political History of Europe since 1814* (New York, 1900), and especially Dahlmann-Waitz, referred to above See BISMARCK-SCHONHAUSEN, CAUVIN, FREDERICK II, THIRTY YEARS' WAR, ETC

GERMAN Y LLORENTE, ġâr-man' è lyô-rân'tà, BERNARDO (1685-1757) A Spanish painter, born at Seville He studied under his father and Cristóbal López He painted the portrait of the Infant, Don Philip, with such success that in 1717 he was called to Madrid b. Philip V, who desired to make him court painter, but he declined the honor, preferring an independent life In 1735 he was made a member of the Academy of St Ferdinand The works of this artist, though inferior to those of Murillo, yet resemble them in their correctness of drawing and groupings, and in other countries they have been sold as original Murillos He so frequently painted the Virgin as a shepherdess that he was called the "Painter of Shepherdesses" One of these paintings is in the Church of San Ildefonso, Madrid, and another in the Prado

GERM CELL See CELL; EMBRYOLOGY

GERMERSHEIM, ġer'mêrs-hîm A town in the Bavarian Palatinate, Germany, situated on the Rhine, 9 miles southwest of Speyer It has manufactures of pressed yeast, creosoted block, or namental stone work, and beer, also much river trade, and fishing is carried on Pop, 1900, 5868, 1910, 5838 The Romans had a station here under the name of Vicius Julii The French were defeated here by the Austrians in 1793

GERMICIDE. See DISINFECTANTS

GERMINAL, zhâr'mé'nal' (Fr., relating to buds) 1 The name for the seventh month of the year in the French Republican calendar, from March 21 to April 19 during the years I-III, and from March 22 to April 20 during the years VIII-XIII 2 One of the Rougon-Macquart novels by Zola (1885)

GERMINAL INSURRECTION. A name given to the bread riots against the Convention at Paris, which occurred on April 1, 1795 (12th Germinal, Year III)

GERMINATION, ġer'mî-nâ'shûn (Lat *germinatio*, from *germinare*, to bud, from *germen* bud) The process by which a spore begins the development of a plant body Technically, only spores germinate, but this term has been extended to include the process by which the embryo escapes from the seed The so-called germination of the seed, however, is not true germination, since it is the escape of an embryo which has already been germinated, and true germination includes the very beginnings of the young plant In the case of a seed, germination begun by a fertilized egg has been checked, and seed germination is the resumption of activity and the escape of the young plant

The conditions of germination are uniform In general, they are suitable amounts of water, of heat, and of oxygen Naturally the range in each one of these factors is very great, some spores germinating in the presence of a comparatively small amount of water, or at a relatively low temperature, while others need a large amount of water or high temperature Between these extremes there is every possible combination of requirements Some spores ger-

minate almost immediately after they have been transported from the parent plant, while others may pass into a resting condition of greater or less duration This difference in habit is generally apparent in the different character of

GERMINATION

1 and 2, germination of pollen grain of pine, 3 and 4, young embryo of buttercup, 5 and 6, first and last stages of embryo of a fern

the spore wall, those spores which are to germinate quickly having thin walls, and those which are to pass into a resting condition having thick walls Since the spore consists of a single cell, the first evidence of germination is the activity of the cell, which usually enlarges, and then divides, resulting in a two-celled embryo One or both of the daughter cells then grow to mature size, and division then occurs In this process of growth and division the spore wall is broken and the young plant emerges and con-

GERMINATION

tinues its development by drawing upon the reserve food supply in the spore until it is able to maintain itself

The early stages of germination have attracted a great deal of attention, under the

impression that they furnish proofs of the relationships of groups. Accordingly the order of succession and the direction of cell walls have been carefully noted. In case the plant is a complex one, after a certain number of cells have been developed, the different regions of the body begin to appear. For example, in an embryonic seed plant it would be impossible for a time to tell what kind of plant is to develop, but after a homogeneous cell mass of greater or less extent is formed, the organs begin to appear which determine the character of the plant.

In the case of alternation of generations (qv) the germination of the sexual spore (fertilized egg) results in a sexless plant (sporophyte), while the germination of the asexual spore results in a sexual plant (gametophyte). Among the heterosporous plants (those producing two kinds of asexual spores), i.e., in certain fern plants and all the flowering plants, the sexual plants (gametophytes) do not escape from the spores which germinate them. For example, the pollen grain is a spore which by its germination produces a male gametophyte, but this gametophyte is so much reduced that it is represented only by a few cells or nuclei within the pollen grain. The same is true of the germination of the megaspore in seed plants, which is retained within the ovule, and which in its germination develops the so-called endosperm, which is the female gametophyte. With the exception of heterosporous plants, however, the germinating plantlet soon escapes from the spore.

In the so-called germination of the seed there are numerous events which may be observed. Attention has been called already to the fact that this process is not technically germination, but merely the renewal of activity and the escape of the young plantlet. Just how long different seeds may retain their vitality in a state of dormancy is not definitely known.

GERMINATION

1, development of *Botrydium* (alga) from the egg, 2, segmentation of egg of a brown alga, 3, a young fungus coming from the egg, 4, young prothallium of *Equisetum*

Some seeds have renewed activity after having remained in a dried-up condition for many years, but such stories as that the wheat taken from the wrappings of Egyptian mummies has been made to germinate are myths. Seed germination results in freeing the embryo from the

seed coats, and in enabling it to establish itself for independent living. The first conspicuous change noted in the seed after the absorption of water is the softening of the contents, the solid or insoluble starch, if that be the form of the food storage, being converted by a process of digestion into soluble sugar ready for transfer. Accompanying this change there is a marked evolution of heat, so that if a large mass of seeds is set to germinating, as in the process of malting, the heat may become very evident. The first part to protrude from the seed is the hypocotyl (qv), the tip of which is thrust out by the rapid elongation of its upper part. This protruding and rapidly elongating tip, which is to develop the root, now rapidly increases in length, and is very sensitive to the influence of gravity and of moisture, responding by developing any curvature necessary to reach the soil. Penetrating the soil and beginning to put out lateral branches, it secures the grip necessary for the extrication of the other regions of the embryo. After some anchorage has thus been obtained the upper part of the hypocotyl again begins a period of rapid elongation, which results in the development of a curve known as the hypocotyl arch. In the case of the germinating bean this arch is the first structure to appear above ground, and its pull upon the seed is very apt to bring it to the surface. Finally, the arch in its effort to straighten pulls the cotyledons out of the seed coats, and with them the stem tip, the axis of the plant straightens up, the seed leaves and sometimes other leaves expand, and germination is over, for with roots in the soil, and green leaves expanded to the air and sunlight, the plantlet has become independent. These details are not the same for all seeds, for there are certain notable variations. For example, in the pea and acorn the cotyledons are so gorged with food as to have lost all power of acting as leaves, and are never extricated from the seed coats. In the cereals, as corn, wheat, etc., the embryo lies close against one side of the seed, so that it is completely exposed by the splitting of the thin skin which covers it. In such a case the cotyledon is never unfolded, but remains as an absorbing organ, while the root extends in one direction and the stem with its succession of ensheathing leaves develops in the other.

The most recent investigations in reference to germination have had to do with delayed germination, especially of seeds, although the same problem is present in the germination of spores. Many seeds and spores cannot germinate immediately, the time elapsing before germination varying widely, but often it is a long period. In many seeds it has been found that the delay in germination is due to the exclusion of water or of oxygen by the seed coat. If such coats are punctured or abraded, germination follows promptly. In nature these impermeable coats must become more or less disintegrated before germination is possible. Some seeds, however, do not germinate, even when the coats have been removed entirely and the embryo put in good germinating conditions. In these cases some change in the embryo is necessary before growth can be resumed, and it is this change that is called "after ripening." The physiological (chemical) changes involved in after ripening have been investigated in the case of certain seeds, and methods have been discovered for shortening the after-ripening period.

The mechanical treatment of impermeable seed coats and the chemical treatment for after ripening have very important practical applications in shortening the period for the production of certain crops

GERMINIE LACERTEUX, zhâr'mě nê' la'-sâr'tê' A realistic romance by Edmond and Jules de Goncourt (1865), in which the authors aim to present, as they say, a "clinic of love" It was dramatized by Edmond de Goncourt, and produced at the Odeon in 1889

GERM-LAYER THEORY See EMBRYOLOGY, *Germ Layers*

GERM PLASM. The kind of protoplasm supposed by some embryologists peculiar to the germinal part of the ovum and regarded as containing such chemical or molecular composition and properties as to determine the special character of the resulting organism. This singularity is supposed to be inherited and to continue from generation to generation See BIOLOGY

GERM THEORY OF DISEASE See DISEASE, GERM THEORY OF.

GERNSHEIM, gërns'hîm, FRIEDRICH (1839-1916). A German composer. He was born at Worms, and studied at Mainz (under Pauer), Frankfurt on the Main, at the Leipzig Conservatory, and in Paris After conducting at Saarbrücken (1861-65) he was called to the Conservatory of Cologne, where he also conducted several musical societies, and in 1873 was appointed to the leadership of the Maatschappij concerts at Rotterdam. In 1890-97 he taught at Stern's conservatory, and from 1890 to 1904 was conductor of the Stern Choral Society in Berlin, one of the most prominent singing societies of Germany His compositions include four symphonies (Gm, Eb, Cm, Bb), an overture, *Waldmeister's Brautfahrt*, a concerto for piano, one for violin, and one for 'cello, several large choral works, *Salamis*, *Hafis*, *Wachterlied*, *Das Grab im Busento*, *Norrenlied*, *Phobus Apollo*; and a great variety of remarkable chamber music

GERO, gâ'rô A German hero in the *Nibelungenlied* He is an historic character who, as Maigrave of the Ostmark, in 939, conquered all the Slavic tribes between the Elbe and the Oder, and died in 965

GEROK, gâ'rôk, KARL (1815-90) A German preacher and religious poet He was born at Vaihingen, Württemberg, Jan. 30, 1815, studied at Tübingen, became chief court preacher in Stuttgart, 1868, and died there Jan 14, 1890 His sermons, and particularly his religious poetry, were much admired The chief collection of the latter was entitled *Palmblätter* (1857), Eng trans by Brown (London, 1869) Consult his life by Braun (Leipzig, 1891); G. Gerok (Stuttgart, 1892)

GERÔME, zhâ'rôm', JEAN-LÉON (1824-1904). A French painter and sculptor, one of the most eminent artists of the later nineteenth century He was born May 11, 1824, at Vesoul, Haute-Saône, France His father, a goldsmith, encouraged the artistic tendencies of his son Léon's copy of a picture by Decamps was seen by a friend of Delaroche, which led to Gérôme's entering the atelier of that master in Paris, at the age of 15 Three years later he went with Delaroche to Rome With the exception of a few months with Gleyre, all Gérôme's early training was received from Delaroche He assisted Delaroche on his picture of "The Passage

of the Alps by Charlemagne," now in the Versailles Museum In 1847 Gérôme was unsuccessful in the competition for the Prix de Rome, but the picture, a "Greek Cockfight," now in the Luxembourg, which he exhibited at the Salon of that year, was the sensation of the day This picture was followed by the "Anacréon, Bacchus, and Cupid" (1848), now in the Museum of Toulouse In 1850 he exhibited the "Greek Interior," and in 1855 the "Age of Augustus," an immense picture now in the Museum of Amiens

All the most splendid qualities of the art of Gérôme appear in the great picture of "Morituri te Salutant" (the "Gladiators before Cæsar"), which was exhibited in 1859 In 1854 Gérôme visited the Danube provinces and Egypt, stopping at Constantinople on the way He was made a member of the Institute and professor of painting at the Ecole des Beaux-Arts in 1865, and won a medal of honor at the Universal Exposition of 1867 He was made Chevalier of the Legion of Honor in 1855, Officer in 1867, and afterward Commander

Gérôme painted an enormous number of pictures, which are largely held in the museums of France. He is also well represented in American collections A partial list only can be given He exhibited the "Phryne before the Tribunal" in 1861, "The Two Augurs" and the portrait of Rachel in 1861, the "Cleopatra and Cæsar" in 1866, the "Slave Market" and the "Death of Cæsar" in 1867, and the "Promenade in the Harem" in 1869 He painted the "Plague at Marseilles" as a decoration in one of the chapels of the church of Saint-Séverin in Paris

Gérôme exhibited his great picture "Pollice Verso," companion to the "Gladiators before Cæsar," in 1873 These two pictures were considered by the painter himself his best works Of his later pictures the most important are "Son éminence grise" (1876, Boston Museum), "Rex Tibicen," "Frederick the Great before the Bust of Voltaire" (1876), "St Jerome" (1878), "Slave Market in Rome" (1884), "Great Bath at Brusa" (1885) The Metropolitan Museum, New York, possesses three of his works, as does also the Vanderbilt collection, including "Louis XIV at the Grand Condé" The Walters Gallery, Baltimore, possesses his "Christian Martyrs" (1803-83), and a replica of the very popular "Duel after the Masquerade," the first rendering of which is in the Chantilly Museum Gérôme was an exceedingly skillful and intelligent painter, but he depended for his effects on his perfect drawing and grouping, his technique is hard and his color often cold.

At the Exposition in Paris in 1878 Gérôme made his début as a sculptor of the first rank with a bronze reproduction of the central group of the "Pollice Verso." The best of Gérôme's later work is in sculpture The most characteristic is a series of bronze equestrian statuettes, among which are "The Entry of Bonaparte into Cairo" (Luxembourg Gallery), "Frederick the Great," and "Tamerlane" His seated statue "Tanagra" and a tinted marble bust of Sarah Bernhardt are in the Luxembourg Museum. In 1902 he completed "L'Aigle expirant," a bronze monument for the battlefield of Waterloo, and the "Game of Ball" Consult his biography by Hering (New York, 1892), Claretie, *Peintres et sculpteurs contemporains* (Paris, 1884); Cook, *Art and Artists of Our Time*, vol i (New York, 1888), Low, "Gérôme," in Van Dyke, *Modern*

French Masters (ib, 1896), Guillemin, *Etude sur le peintre et sculpteur Jean Léon Gérôme* (Besançon, 1905)

GERONA, hâ-rō'na A town of Tárlac, Luzon, Philippines, on the Manila and Dagupan Railroad, 9 miles north of Tárlac Pop, 1903, 13,615

GERONA, hâ-rō'na An episcopal city, the capital of the province of the same name, Spain, 52 miles northeast of Barcelona, situated at the junction of the rivers Oñar and Ter (Map Spain, G 2) Built at the foot and on the slope of two hills, the fortified Monjuich commanding the city, it comprises two parts, the city proper on the side of the Hill of the Capuchins, with the narrow, dingy streets of a mediæval town (which nevertheless has the finest architectural features), and the modern suburb, El Mercadel, in the plain below The rivers Guell and Galligans empty into the Oñar, the former just north of the city, while the latter flows through it, and many of the houses are built directly on the river's brink—a circumstance that has caused the floods, particularly those of 1762 and 1829, to be extremely disastrous Gerona still retains part of its old walls, but its chief attractions are in its churches The noble Gothic cathedral (begun in 1312), one of the finest in Spain, stands on the site of an earlier church dedicated in 1038, the nave, 73 feet in width, is the widest Gothic vault in the world Also noteworthy are the fourteenth-century church of San Felix and the Romanesque church of San Pedro There are a large poorhouse, a hospital in connection with which is an insane asylum, a theatre, and two public libraries, the provincial library having over 13,000 volumes The citadel serves as a state prison The manufactures of the city comprise paper, cotton and woolen goods, machinery, cork, and in the vicinity coal, iron, copper, and lead are mined There are also mineral springs Pop, 1900, 15,668, 1910, 17,416

Gerona, the ancient Gerunda of the Auscetani, is one of the oldest cities of Spain, its origin being ascribed to the tenth century B C, though it appears first in history during the Punic Wars In the Middle Ages it was known also as Girona The town submitted to the Moors in 717 and in 797 came finally into the possession of the Frankish borderers, who for a time ruled it in the name of their kings Subsequently it passed into the possession of the counts of Barcelona It was erected into a dukedom about the middle of the fourteenth century, and in 1414 into a principality for the eldest son of the King of Aragon Gerona played a part in the War of the Spanish Succession, suffering severely with the rest of Catalonia It became celebrated for the stubborn fighting qualities of its inhabitants Its crowning exploit was achieved in 1809 in the Spanish War of Liberation, when it held out from June 8 to December 10 against the French, who had invested it in 1808, yielding only when its citizens succumbed to famine and disease

GERONIMO (c 1834-1909) A chief of the Chiricahua tribe of Apache Indians His native name was Goyathlay (the yawner), and Geronimo is only a Mexican nickname He was born in New Mexico, near old Fort Tulerosa In 1876 with other chiefs he fled to Mexico rather than be removed to San Carlos, Ariz., with the other Chiricahua But he was caught and taken to Arizona In 1882 he led a raid into Sonora,

but surrendered to General Crook During 1884-85 there was an attempt to stop the Indian manufacture of intoxicants, and Geronimo with a band of hostile Indians terrorized a great part of New Mexico and Arizona and some of Sonora and Chihuahua Against them, early in 1886, General Sheridan sent Gen George Crook In March a truce was made, and at a conference between Crook and Geronimo terms of surrender were agreed upon Before they could be carried out, however, the Indians escaped to the Mexican mountains, and General Crook was superseded in command by Gen Nelson A Miles General Miles immediately began an active campaign against the Indians He followed them into the mountains until at length Geronimo was glad to accept the terms offered by General Miles, which provided for the deportation of Geronimo and his leading followers to Fort Pickens, Fla Later they were taken to Alabama and then to Fort Sill, Okla Consult *Geronimo's Story of His Life, Taken Down and Edited by S M Barrett* (New York, 1906), and articles on the campaign against him in the *Journal of the United States Cavalry Association* (Fort Leavenworth), vols xix and xxi

GÉRONTE, zhâ'rônt' In French classical comedy, a type of the old man The character appears especially in Corneille's *Le menteur*, in Molière's *Le médecin malgré lui* and *Les fourberies de Scapin*, and in Regnard's *Le joueur*, *Le retour imprévu*, and *Le légataire universel* In the *Menteur* the character has dignity and restrained emotion In the *Médecin malgré lui* and the *Fourberies* he has become purely a grotesque dupe, miserly, obstinate, and credulous.

GEROUSIA, jê-rô'shî-a (Γερουσία, from γέρων, gerôn, old man) The Council of Elders, or Senate, at Sparta, corresponding somewhat to the Athenian Boule (βουλή) Consult Gilbert, *Greek Constitutional Antiquities*, Eng trans (London, 1895)

GERRESHEIM, gër'ës-him A town in the Rhine Province, Prussia, a western suburb of Dusseldorf, taken within the city limits in 1909 It is an industrial centre of growing importance, with extensive glass, wire, rivet, and silk factories, and other manufacturing establishments Its Romanesque parish church dates from the thirteenth century Pop, 1905, 14,431

GERRY, gër'ri, ELBRIDGE (1744-1814) An American statesman He was born at Marblehead, Mass, July 17, 1744, the son of a merchant He graduated in 1762 at Harvard, where three years later he took a master's degree and, abandoning his original intention of entering the medical profession, became a successful merchant in his native town In May, 1772, he entered upon his long political career as a member of the General Court of Massachusetts, and here immediately identified himself with the Patriot party, particularly as represented by Samuel Adams, with whom from this time forward he was closely associated in opposition to the arbitrary measures of the British ministry He was appointed by the Legislature, with Hancock and Orne, a member of the Committee of Correspondence, and in 1774 and 1775 was a prominent member of the Massachusetts Provincial Congress, by which, after the battle of Lexington, he was charged with procuring a supply of gunpowder for the Province Late in 1775 he introduced a bill, passing on November 10, for arming and equipping ships for aggressive service against the British mercantile and

military maine This bill, says Gerry's biographer, Austin, was "the first actual avowal of offensive hostility against the mother country which is to be found in the annals of the Revolution," and the "first effort," as well, "to establish an American naval armament." Samuel Adams spoke of it as "one of the boldest, most dangerous, and most important measures in the history of the New World, the commencement of a new maritime and military power." In 1776 Gerry was elected to the Continental Congress, in which he served for the next four years, during which time he took an active part in securing the passage of many measures of importance, was a member of various important committees, and in particular was conspicuous as a vigorous advocate of the Declaration of Independence, which he signed. He was also prominent as a member of three committees appointed (in September, 1776, July, 1777, and November, 1777) to visit Washington's camp on behalf of Congress, and more especially as a member of a standing committee for superintending the treasury, of which he was for some time chairman, and which exercised a virtual control over the finances of the country throughout the Revolutionary War. He was accused, but apparently with little justice, of supporting, or at least countenancing, the Conway Cabal (qv) in its efforts to displace Washington, and in 1779, as head of the treasury board, came into conflict with Gen. Benedict Arnold, some of whose accounts he had refused to audit. In February, 1780, he withdrew from Congress owing to its refusal to record the yeas and nays on a question of order raised by him, and the Massachusetts General Court, to which he appealed, sustained him in his position. On his return to Massachusetts he was elected a member of both the Upper and the Lower House in the first Legislature under the new State Constitution, and accepted a seat in the latter.

In 1783 he resumed his seat in the Continental Congress, which he retained for three years, during which time he was a member of the committee appointed, in 1783, to consider the definitive treaty of peace, was chairman of each of two committees appointed to choose a suitable location for a national capital, and again took a prominent part in the initiation and discussion of financial measures. He was also conspicuous in 1784 as an opponent of the Society of the Cincinnati. He again became a member of the Lower House of the State Legislature in 1785, declined an appointment to the Annapolis Convention (qv) in 1786, and in 1787 was sent as one of the Massachusetts delegates to the Constitutional Convention at Philadelphia, where he was prominent as an opponent of the Constitution as finally adopted, refusing, along with Randolph and Mason, to affix his signature. His chief objections, as stated by himself, were, "that there is no adequate provision for a representation of the people, that they have no security for the right of election, that some of the powers of the Legislature are ambiguous and others indefinite and dangerous, that the Executive is blended with and will have an undue influence over the Legislature, that the judicial department will be oppressive, that treaties of the highest importance may be formed by the President, with the advice of two-thirds of a quorum of the Senate, and that the system is without the security of a bill of rights." After the organization of the government he was elected one of the

representatives of Massachusetts in the first and second Congresses under the Constitution. Subsequently he remained in retirement at Cambridge until 1797, when, war with France appearing imminent, he was sent, along with Marshall and Pinckney, on an important mission to the French Directory. The envoys, unable to secure official recognition, were forced to submit to various indignities and humiliating rebuffs, while disgraceful propositions were made to them by Talleyrand and his secret agents, and Marshall and Pinckney soon left in disgust. Gerry, however, being the only Republican on the commission, and therefore being, presumably, more favorably disposed than his colleagues towards the French government, remained for some time longer, at the request of Talleyrand, but accomplished nothing. (See X Y Z CORRESPONDENCE.) For thus remaining he was acrimoniously attacked by the Federalists upon his return to the United States. He was several times defeated for Governor of Massachusetts, but was successful in 1810, and in 1811 was reelected. His administration was fiercely criticised by the Federalists on the ground of its alleged partisanship, and color was given to the charge by the enactment by the Republican Legislature of a law, which Gerry signed, but of which he seems to have disapproved, for redistricting the State in such a manner as to annihilate the Federalist majorities in several counties. (See GERRYMANDER.) From 1813 until his death he was Vice President of the United States. He died suddenly on his way to the Capitol, Nov. 23, 1814. Consult Austin, *Life of Elbridge Gerry, with Contemporary Letters* (Boston, 1828-29).

GERRY, ELBRIDGE THOMAS (1837-1927) An American lawyer and philanthropist, born in New York City, a grandson of Elbridge Gerry (qv). He graduated at Columbia College in 1857. During his practice as a lawyer he appeared in some important cases and accumulated one of the finest libraries of works on jurisprudence in America. In 1867 he was a member of the State Constitutional Convention. He became prominently connected with numerous reformatory and benevolent organizations, and in 1874 founded the Society for the Prevention of Cruelty to Children, of which he was president in 1876-1901, until 1899 he was vice president of the American Society for the Prevention of Cruelty to Animals. In 1886-88 he was chairman of the New York State commission which substituted electrocution for death by hanging. He was commodore of the New York Yacht Club in 1886-93, and was a director in several large trust companies. With A. F. Currier he wrote *Corporal Punishment for Certain Forms of Crime* (1895).

GERRYMANDER, gĕr'ri-măn'dĕr A word belonging to the political vocabulary of the United States and used to denote an unfair division of the electoral districts in a State, made in the interest of one of the political parties. The word was coined in 1812, though the practice was in use as early as the beginning of the eighteenth century. At that time the Federalist and Republican parties in Massachusetts were nearly evenly balanced in numerical strength, but the Republicans took advantage of a temporary majority in the Legislature to divide the State into new senatorial districts in such a manner that those sections which gave a large number of Federalist votes might be brought

into one district. Previously each county had constituted a senatorial district, and the power of rearranging old districts or creating new ones, bestowed on the Legislature by the State constitution, had never been exercised. Elbridge Gerry (q v) was at that time Governor, and through his signature, though he seems not to have wholly approved the measure, the work of the Legislature became a law. The form of one of the districts into which Essex County was divided was somewhat like that of a monstrous animal, and when some one suggested that it looked like a salamander, the name "gerry-mander" was given to it instead. The passage of the law caused a great outcry from the Federalists, and early in 1813, this party having again secured a majority and elected a Governor (Caleb Strong) to succeed Gerry, the law was repealed. The device, however, has since been repeatedly used in various States. For an account of the origin of the term, consult Dean, "The Gerry-mander," in the *New England Historical and Genealogical Register*, vol. xlv (Boston, 1892), and Griffith, *The Rise and Development of the Gerry-mander* (Chicago, 1907).

GERs, zhâr. An interior department in the southwest of France, formerly portions of the provinces of Gascony and Guienne (Map France, S, E 5). Area, 2428 square miles. Pop., 1901, 238,448, 1911, 221,994. While the surface is hilly, its highest point does not exceed 1300 feet. Its principal rivers are the Gers, the Adour, Save, Gimone, and Bayse. Over 24 per cent of the surface is devoted to the cultivation of the grape, from which large quantities of brandy and wine are manufactured. The brandy produced in this department is known as Armagnac and is considered as second only to that of Cognac. Wheat, oats, and flax are extensively grown. The cattle-raising industry is important, and there is a brisk trade in turkeys and geese. Capital, Auch.

GERSAU, gër'sou. A health resort of Switzerland, situated in the Canton of Schwyz on the north bank of Lake Lucerne (Map Switzerland, C 1). Its situation is very picturesque and its equable and mild climate makes it a very desirable winter resort for invalids, while in summer it is a crowded and popular tourist resort. For four centuries after 1390 Gersau was entirely independent, forming the smallest republic in Europe. At the formation of the Helvetic Republic in 1798 Gersau became a part of the Canton of Waldstätten, and was subsequently (1803) incorporated with the Canton of Schwyz. Pop., 1900, 1887, 1910, 1821.

GER'SHOM, or **GER'SHON**. A name given to two individuals in the Old Testament. 1. The first-born son of Moses and Zipporah, according to Ex. 11:22, xviii:3. In Judg. xviii:30, Gershom, or Gershon, is said to be the father of Jonathan, the priest officiating at the sanctuary of Dan (see HIGH PLACE), and the son of Manasseh or Moses. The only difference between these two names when written with the Hebrew characters is the letter *nun*. While Manasseh is found in many manuscripts, most frequently the *nun* is put above the line, and in some cases it has been added by a later hand. Most of the ancient versions read "Manasseh", but some manuscripts of the Greek version and the Latin Vulgate read "Moses." It is therefore difficult to determine what the original reading was. Evidently the priesthood at Dan traced its origin either to Manasseh or to Moses, or to

both at different periods. As the 13 cities assigned to the Levitic clan of the Gershonites were all in eastern Manasseh, Issachar, Asher, and Naphtali (Josh. xxi:27, 33), it is possible that the Gershonite priesthood at Dan considered itself of Manasseh origin, and even that the cult in this place was once devoted to the divinity who afterward became the eponymous hero of the tribe of Manasseh. A claim to Mosaic descent would then be a later development. Another view is that the suspended *nun* is a device to gloss over the unpleasant fact that a grandson of Moses was priest at a temple where a Yahwe image was worshiped. The priestly legislation knows of no sons of Moses in the priesthood. 2. The first-born son of Levi, according to Ex. vi:16, Num. iii:17, 1 Chron. vi:1, 16, xxiii:6. In reality this Gershon is the eponym of a Levitic family in the Persian and Greek period. In the sketch of the tabernacle in the wilderness, the Gershonites are the carriers of curtains, coverings, screens, and hangings belonging to this movable sanctuary. In the narrative of David's reign they figure as musicians belonging to the family of Asaph. It is probable that the Gershonites furnished some of the musicians as well as some of the janitors for the second temple. Whether they were descendants of the Gershonites who once were priests at Dan is not certain, but it is quite probable.

GERSON, zhâr'son', JEAN CHARLIER DE (1363-1429). An eminent French scholar and divine. He was born at Gerson, in the Diocese of Rheims, Dec. 14, 1363. He entered the University of Paris, and studied theology under the celebrated Pierre d'Ailly. Here he rose to the highest honors of the university and, when only 32, to its chancellorship (1395), having acquired by his extraordinary learning the title of "the Most Christian Doctor." He did much for the reform of the university. During the contests which arose out of the rival claims of the two lines of pontiffs in the time of the Western Schism (q v) the University of Paris took a leading part in the negotiations for union, and Gerson was one of the most active supporters of the proposal of the university for putting an end to the schism by the resignation of both the contending parties. He visited the other universities, in order to obtain their assent to the plan proposed by that of Paris. But although he had the satisfaction to see this plan carried out in the Council of Pisa (1409), it failed to secure the desired union. In a treatise inscribed to his friend Pierre d'Ailly, he renewed the proposal that the rival pontiffs (now not two, but three, since the election of John XXII at Pisa) should be required to resign, and in the new council which met at Constance in 1414 he was again the most zealous advocate of the same expedient of resignation. It is to him also that the great outlines of the plan of Church reformation, then and afterward proposed, are due (See CONSTANCE, COUNCIL OF). But his own personal fortunes were marred by the animosity of the Duke of Burgundy and his adherents, to whom Gerson had become obnoxious, and from whom he had already suffered much persecution, on account of the boldness with which he had denounced the murder of the Duke of Orléans. To escape their vengeance he was forced to remain in exile, and he retired from Constance (1418) in the disguise of a pilgrim, to Rattenberg, in Bavaria, where he composed his celebrated work, *De Consolatione Theologæ*,

in imitation of that of Boethius, *De Consolatione Philosophiae*, later he went to Neuburg. It was only after the lapse of two years that he was enabled to return to France and take up his residence in a monastery at Lyons, of which his brother was superior. He devoted himself in this retirement to works of piety, to study, and to the education of youth. He died in Lyons July 12, 1429. His works fill five volumes in folio. Among the books formerly ascribed to him was the celebrated treatise *De Imitatione Christi*, but it is no longer doubtful that the true author is Thomas à Kempis (qv). The best and most complete edition of his works is by Dupin (Antwerp, 1706). Consult his life by Schwab (Wurzburg, 1858), Jadart (Rheims, 1882), Reynolds, *Early Reprints for English Readers John Gerson* (London, 1880), Bess, *Zur Geschichte des Konstanzer Konzils* (Munich, 1891), Creighton, *History of the Papacy*, vols. 1 and 11 (London, 1882).

GERSON, gér'son-y', WOJCIECH (1831-1901). A Polish historical painter, born at Warsaw. He began his studies at the School of Art, and continued them at the Academy of St. Petersburg, and under Léon Cogniet in Paris. Subsequently appointed professor in his native city, he exercised a far-reaching influence upon the promotion of art in Poland as the master of many of the distinguished Polish painters of the day, and as the founder of the Art Society in Warsaw. He was a member of the St. Petersburg Academy. Among his highly valued pictures, noted for thoughtful conception and high finish, may be mentioned "Conversion of the Slavs to Christianity in the Tenth Century", "Queen Hedwig in the Castle at Cracow", "Count Casimir the Righteous", "Copernicus in Rome", "Haughty Queen Rixa of Poland," besides many other episodes from Polish history.

GERSONIDES, gér-són'i-déz, or LÉON DE BAGNOLS (c.1288-1344). A distinguished Jewish philosopher, physician, astronomer, and commentator, known in Jewish literature as Levi ben Gerson. He was born in Arles, of a family of scholars. He made many accurate observations in astronomy, and wrote commentaries on parts of the Bible. His best work is called *Milchamot Adonai*, "Wars of the Lord," and is a daring philosophical treatise. Though his philosophy is based on that of Maimonides, it passes beyond this writer in various points. His works gained a reputation among Christian scholars, and certain portions were translated into Latin by order of Pope Clement VI (1342). He died at Perpignan. Consult Joel, *Levi ben Gerson als Religionsphilosoph* (Breslau, 1862), and Winter and Wunsche, *Jüdische Litteratur*, vol. II (Trevs, 1894).

GESOPPA (gér-söp-pá). **FALLS**. The finest falls in India on the Sharawati River, 30 miles southeast of Honawar at the mouth of the river on the west coast. It consists of four falls known as the Great, the Roarer, the Rocket, and the *Dame Blanche*, or White Lady, names descriptive of their general features. They descend on three sides of an immense chasm 600 feet wide, the Great Fall leaping down 829 feet into an enormous pool 132 feet deep.

GERSTACKER, gér'stāk-ēr, FRIEDRICH (1816-72). A German romancer of adventure. Born in Hamburg, May 10, 1816, the son of an opera singer, and left early an orphan, he came to the United States in 1837, and for seven years wandered over the country supporting himself as

a jack of all trades and for some time as a hunter. In 1843 he returned to Germany and turned his experiences to profitable account in the widely popular *Streif- und Jagdzüge* (1844), *Die Regulatoren in Arkansas* (1845), *Die Flusspiraten des Mississippi* (1848), and many other volumes of similar character. In 1849 Gerstacker came again to America and visited also Polynesia and Australia, basing on this voyage his *Tahiti*, and an Australian story, *Die beiden Straflinge*, both of which are among his best work. In 1860 he went to South America, and in 1862 accompanied Duke Ernest of Saxe-Coburg-Gotha to Egypt and Abyssinia. In 1867-68 he revisited the United States, traveling also in Mexico, Ecuador, Venezuela, and the West Indies, and he gave a vivid account of his experiences in *Neue Reisen* (1868), and in several novels, *Die Missionare* (1868), *Die Blauen und die Gelben* (1870), and others. Gerstacker's gifts of description are very considerable, his character drawing is vivid and realistic, his style straightforward and unstudied. Many of his stories have been popular in English translations. He died in Brunswick, May 31, 1872. His collected works appeared in 44 vols. (1872-79).

GERSTACKER, KARL EDUARD ADOLF (1828-95). A German zoologist. He was born and educated in Berlin, where in 1857 he was appointed lecturer on zoology at the university and director of the entomological collection in that institution. During the last 20 years of his life he was professor of zoology and director of the zoological museum at Greifswald. His principal works include: *Entomographien* (vol. 1, 1858), *Zur Morphologie der Orthoptera Amphibiotica* (1873), *Die Wanderheuschrecke* (1876), and *Der Colorado-Käfer* (1877).

GERSTENBERG, gér'sten-bérk, HEINRICH WILHELM VON (1737-1823). A German poet, dramatist, and critic, born at Tondern (Schleswig). He was educated at Jena, entered the Danish army, became a captain of cavalry in 1763, and in 1766 was retired from the service on half pay. In 1771 he resigned, in 1775 was appointed Danish consul at Lubeck, and from 1785 to 1812 was legal director of the royal lottery at Altona. He is known for three works of important influence in German letters. His *Gedicht eines Staldden* (1766) introduced into German literature a revival of Norse mythology. His tragedy *Ugolino* (1768), based on Dante, sympathetically criticized by Lessing, attracted much attention and was one of the earliest "*Sturm und Drang*" dramas. His *Briefe über Merkwürdigkeiten der Litteratur* (1766-70) contributed much in German towards a just estimate of Shakespeare, and by its complaint against the reigning formality in German literature indirectly helped to prepare the way for the "*Sturm und Drang*." A collection of his *Ver-mischte Schriften*, edited by himself, appeared in 1815.

GERSTER, gér'stēr, ARPAD GEYZA (CHARLES) (1843-1923). An American surgeon. He was born at Kassa, Hungary, graduated in medicine at the University of Vienna in 1872, and was assistant surgeon in the Austrian army in 1872-73. He served after 1878 as surgeon at the German Hospital and after 1879 at Mount Sinai Hospital (both in New York City); was professor of surgery at the New York Polyclinic in 1882-94, and became professor of clinical surgery at Columbia University. In 1911-12 he was president of the American Surgical As-

sociation. He is author of contributions to medical journals and of *Rules of Aseptic and Antiseptic Surgery* (1888, 3d ed, 1890).

GERSTER, ETELKA (MME GARDINI) (1855-1920). A Hungarian singer, born at Kaschau. After studying at the Vienna Conservatory under Marchesi she made her début in 1876 as Gilda in *Rigoletto*, subsequently singing with great success in Marseilles, Genoa, and Berlin. In 1877 she married Pietro Gardini. In 1878 (and again in 1883 and 1887) she made a tour of the United States, and also sang in the principal European cities. In 1896 she opened a singing school in Berlin. After 1905 she was connected with the Institute of Musical Art in New York City.

GERSTNER, gërst'nër, FRANZ ANTON VON (1793-1840). An Austrian engineer, a son of Franz Josef von Gerstner (1756-1832). He was born and educated at Prague, and in 1818 was appointed professor of practical geometry at the Polytechnic Institute, Vienna. He went to England several times to investigate railroad building in that country, especially the road from Liverpool to Manchester, which was at that time in course of construction. In 1823-24 he made the plans of the Budweis-Linz (horse-power) Railroad, the first to be constructed on the continent of Europe (opened 1832). He built the road from St. Petersburg to Tsarskoye-Selo, and organized other railroads in Russia. In 1838 he visited America, where he examined the railroads then either built or building in the United States. Two years after his sudden death in New York City a description of his American tour was published by his wife under the title *Beschreibung einer Reise durch die Vereinigten Staaten von Nord-Amerika* (1842). A similar work, but more technical in character, embodying the investigations of Gerstner in America, was edited in 1842 by L. Klein, under the title *Die inneren Kommunikationen der Vereinigten Staaten von Nord-Amerika*, an interesting work in two volumes on the means of communication then existing in the United States.

GERTRUDE 1. A Belgian saint (626-59), whose fête is celebrated on March 17. She was the daughter of Pepin of Landen and Ida of Aquitaine. Dagobert I urged her to marry him, but she refused and, taking the veil, became abbess of Nivelles in Brabant. A number of churches in Belgium are dedicated to her. She is a patron of travelers, especially by sea, and is held to give protection from rats and mice and fever. She is represented in art with rats and mice about her. 2. Saint GERTRUDE of Eisleben (1256-1311), called Gertrude the Great, entered the convent of Helfta when 5 years old and became a great student. Her mystical visions began in 1271, and from that time she gave herself particularly to the study of the Scriptures. Her visions she describes in *Legatus Divinae Pietatis* and the seven *Exercitia Spiritualia* (1662), often reprinted. Her fête is kept on November 15.

GERTRUDE OF WYOMING. A pathetic and graceful, though not flawless, poem by Thomas Campbell, which appeared in 1809.

GERUSALEMME LIBERATA, jâ-rôo'-sâ-lëm'-mâ lê'bâ-râ'tâ (It, Jerusalem Delivered). A famous poem by Torquato Tasso, published at Venice, 1580, in 16 cantos, the narrative of real and fictitious events connected with the First Crusade and the deliverance of Jerusalem under Godfrey of Bouillon. English translations

were published by Fairfax in 1600 and by James in 1865 and 1884.

GÉRUZEZ, zhâ'ru'zâ', (NICOLAS) EUGÈNE (1799-1865). A French critic, born at Rheims. He was the nephew of Jean Gérusez (1763-1830), the author, and held the chair of eloquence at the Sorbonne for 19 years. Besides contributions to the best journals of the time, he wrote a number of valuable critical works, such as *Histoire de l'éloquence politique et religieuse en France au XIV^{ème}, XV^{ème} et XVI^{ème} siècles* (1837-38), *Essais d'histoire littéraire* (1838), *Histoire de la littérature française depuis ses origines jusqu'à la Révolution* (1852), *Histoire de la littérature française pendant la Révolution* (1859), *Mélanges et pensées* (1886).

GERVAIS, zhâr'vâ', ALFRED ALBERT (1837-1921). A French admiral, born at Provins. After serving in the Crimean, Chinese, and Franco-German wars, he was appointed captain in 1871. In 1884 he became chief of staff in the Naval Department at Paris. He became rear admiral in 1887, vice admiral in 1892, and commanding admiral of the Mediterranean squadron in 1896, and in 1900 commanded the canal squadron which received the Czar at Dunkirk.

GERVAIS, FRANÇOIS LOUIS PAUL (1816-79). A French paleontologist, born in Paris. He graduated there as doctor of sciences and of medicine, and in 1835 was appointed assistant to Blainville, professor of comparative anatomy at the Paris Museum. In 1841 he became professor of zoology and comparative anatomy in the Faculty of Sciences of Montpellier, in 1865 professor at the Sorbonne, Paris, and in 1868 professor of comparative anatomy at the Museum of Natural History. He was appointed a correspondent of the Institute of France in 1861, and elected a foreign member of the Geological Society of London in 1875. He early began the study of the "insecta aptera" of Linnaeus, particularly the myriapods, and prepared the *Histoire naturelle des insectes aptères* (1844-47), comprising volumes three and four of the *Suites à Buffon* begun by Walckenaer. It is, however, for his researches concerning the Tertiary mammalia that he is best known. In this field his most important contributions are his *Histoire naturelle des mammifères* (1854-55) and *Zoologie et paléontologie générales* (1867). The *Recherches sur les mammifères fossiles de l'Amérique Méridionale* (1855) should also be mentioned.

GERVASE (jër'vâz) OF CANTERBURY (?1141-?1210). An English chronicler. He became a monk of Christ Church, Canterbury, in 1163, and sacristan in 1193, and seems to have spent all the rest of his life there. His earliest known work is a *Tractatus de Combustione et Reparatione Cantuariensis Ecclesiae*, being an account of the conflagration of 1174, and of the subsequent process of rebuilding, written probably in 1185. This was followed by *Imaginatio Gervasii Quasi Contra Monachos Cantuariensis Ecclesiae*, and other treatises containing a detailed relation of the clerical disputes at Canterbury. Gervase's *Chronica* of the times of Stephen, Henry II, and Richard I, probably begun about 1188, brings the history down to the death of the last-named King. His *Actus Archiepiscoporum Cantuariensium* comes down to the death of Hubert Walter in 1205. His *Gesta Regum* extends from Brutus to 1210, and is continued by other authors to 1328. In addition, he wrote a *Mappa Mundi*, a survey of the counties of Eng-

land Gervase died, probably, very soon after 1210. All of his works have been edited by Stubbs, in two volumes, *Rolls Series* (1879-80). The preface contains a full account of his life.

GERVASE OF TILBURY (fl c 1175-1215)

A mediæval writer on historical and philosophical subjects, born probably at Tilbury in Essex, England. He seems to have been brought up in Italy, and to have studied and taught at Bologna. He was at Venice in 1177 when Frederick I and Alexander III met. He was at the English court about 1183, and later went to Sicily. In 1190 he was at Salerno. He entered the service of Otho IV, who made him Marshal of the Kingdom of Arles, and to whom he dedicated his only extant work, the *Otia Imperialia*. This was written about 1211-1214, and is divided into three parts. In the first Gervase discusses the events in the early chapters of Genesis, the origin of music, etc., in the second he treats of history, geography, and politics, in the third, of marvels. The last is exceedingly valuable for the light it throws upon the beliefs of the age. This work was published in Leibnitz, *Scriptores Rerum Brunsvicensium* (2 vols., Hanover, 1707-10). Consult Molmier, *Les sources de l'histoire de France* (Paris, 1903).

GERVEX, zhâr'vâ', HENRI (1852-1913). A French genre and portrait painter, born in Paris. He was the pupil of Cabanel, Brisset, and Fromentin, and first exhibited in 1873. His "Satyr Playing with a Bacchante" (1874) is in the Luxembourg. After this date his works were more often of contemporary life. These include "Communion at the Church of the Trinity", "The Lady with the Masque", "Rolla," a fine nude, excluded from the Salon of 1878. "The Return from the Ball", and "Dr Péan at La Salpêtrière," a realistically treated scene in an operating room, one of the first works in this genre to be represented in modern art. In this as in all his works, the technique is excellent, the color quiet and harmonious, the handling of light very skillful. With Blanchon he produced four decorative paintings of civil subjects for the mayor's office of the nineteenth arrondissement. His portraits are notable, particularly "The Picture Jury" (1885) and the portrait of Madame V de la B., both in the Luxembourg. He received the cross of the Legion of Honor in 1889. In 1900 he exhibited "The Coronation of Nicholas II at the Kremlin," and in 1913 was elected to the Academy des Beaux-Arts to succeed Aimé Morot.

GERVILLE-BÉACHE, jêr'vêl'-râ'ash', JEANNE (1882-1915). A French dramatic mezzo-soprano, born at Orthez, France. She received her first musical instruction from her father and local teachers. In 1899 she studied with Rosine Laborde in Paris, in 1899-1900 with Pauline Viardot-Garcia and Jean Criticos. She made her début as Orphée, in Gluck's opera, at the Opéra Comique in Paris in 1900. In 1902 she sang at the Théâtre de la Monnaie in Brussels. From 1904 to 1906 she appeared as guest in London and throughout France, from 1907 to 1910 she was one of the principal artists of the Manhattan Opera House in New York, in 1911-12 of the Chicago Opera Company, appearing also as guest with the Boston Opera Company. In 1913-14 she was a member of the National Opera Company of Canada. During 1910 and 1912 she made extended concert tours of the United States. At the première of *Pelléas et Mélisande* she created the part of the

Queen. Her voice was a rich mezzo-soprano which she used with rare skill. Her repertoire included Italian, French, and German operas. In 1908 she was married to Dr Gibier-Ramnaud, the director of the Pasteur Institute at New York.

GERVINUS, gër-vē'nus, GEORG GOTTFRIED (1805-71). A German historian and literary critic. He was born at Darmstadt, May 20, 1805, studied, after some years devoted to commercial pursuits, at Giessen and Heidelberg, taught at Frankfort, and became professor at Heidelberg in 1835 and at Göttingen in 1836. He had already printed some historical work of minor value, but now began the publication of what came at last to be known as his *Geschichte der deutschen Dichtung* (1835-42, 5th ed, 1871-74) (the first attempt at a scientific treatment of the subject), which has passed through many editions. In 1837 he, in common with six other liberal professors, lost his chair by a protest against the suspension of the Hanoverian Constitution, was banished, and traveled for a time in Italy. In 1844 he received a call to Heidelberg as professor. Some years were now given to political writing in pamphlets and periodicals in the interest of constitutional liberty, but the failure of liberal hopes in 1848 brought him back to literature. He wrote four volumes on *Shakespeare* (1849-50), a liberal and very influential *Geschichte des neunzehnten Jahrhunderts* (8 vols., 1853-66), *Handel und Shakespeare* (1868), and *Handel's Oratorienteate übersetzt von Gervinus* (1873). He died at Heidelberg, March 18, 1871, deeply dissatisfied with the manner in which Prussia had brought about the unification of Germany. Consult *G. G. Gervinus Leben: von ihm selbst* (Leipzig, 1893).

GERWIG, gër'vik, ROBERT (1820-85). A German railroad engineer, born at Karlsruhe and educated at the Polytechnic Institute in that city. In 1866 he projected the railroad through the Black Forest, and completed that difficult piece of engineering, with its numerous tunnels, in seven years. From 1872 to 1876 he had charge of the building of the St Gotthard Railroad, which, together with Beckh, he had planned. He afterward was appointed director of construction for the railways of Baden.

GERYON, jêr'i-ôn, or **GERYONES**, jê-rî'ô-nêz (Lat., from Gk. Γερώνης). In Greek mythology, the son of Chrysaor and Callirhoe, a giant with three heads and three bodies, the ruler of the western island Erythra (see *HESPERIDES*), where he kept a great herd of cattle. They were guarded by the herdsman Eurytion and by a monstrous two-headed dog Orthros, both of whom Hercules slew, together with Geryon himself, when he went to carry off the cattle as one of his 12 labors. On his return from this expedition Hercules made his way into Italy and to the site of Rome, there he slew Cacus and so aided Evander.

GESELLSCHAFT DER OSTERREICHISCHEN MUSIKFREUNDE, ge-zêl'shaft dêr ô'ster-rik'ish-en môo-zêk'froun'de (Ger., Society of Austrian Friends of Music). One of the oldest orchestral organizations in Europe. It was the direct outcome of a festival concert given in Vienna on Nov 29, 1812, in aid of the sufferers from the war with France. The work performed was Handel's *Timotheus*, which was received so favorably that the performance was repeated December 3. Then Sonnleithner issued a circular urging all persons interested in music to form a society for the performance of larger

works Many lovers of the art responded, so that in 1814 the statutes of the new society were approved by the Emperor Francis I At the head of this organization was a "protector," who was always a nobleman The first protector was Beethoven's pupil, the Archduke Rudolf In 1835 the office of protector was abolished, and a president elected, who for many years was also a nobleman But in 1867 artistic considerations led to the election of the citizen Dr F Egger For the first five years the programmes consisted of oratorios, then mixed programmes were substituted, and even choral works were not excluded All members were on an equal footing The conductor was chosen by lot from among the members, many of whom were amateurs Symphonies were performed in a curious and inartistic manner, Italian arias being interspersed between the different movements until as late as 1846 Not before 1824 was a symphony (the *Eroica*) performed consecutively and in its entirety After 1840 the artistic standard of the society declined Programmes were arranged with bad taste, the execution became careless, and new works and composers were ignored The establishment of the Akademie der Tonkunst in 1851 led to a radical reform of the Gesellschaft, Hellmesberger being then elected a conductor This ambitious and energetic musician filled the places of amateurs by professional musicians, offered artistic programmes, and brought the orchestra to a high degree of technical efficiency New composers now also found a ready hearing This work was continued by the new conductor, Herbeck, who was elected in 1859, and ever since its concerts have been among the musical events of Vienna Among the conductors of the Gesellschaft have been Brahms and Richter Since 1904 Franz Schalk has been the conductor Consult Perger and Hirschfeld, *Geschichte der K K Gesellschaft der Musikfreunde in Wien* (Vienna, 1912)

GESEL'SCHAP, FRIEDRICH (1835-98) A German historical painter He was born at Wesel and studied at the Dresden Academy, then under Mintrop and Bendemann in Düsseldorf, and from 1866 to 1871 in Rome, where he gave his special attention to the monumental fresco paintings of Raphael and Michelangelo In Berlin he became more widely known by his competitive designs for the decoration of the Kaiserhaus in Goslar (1877), and attained celebrity with his mural paintings in the Ruhmeshalle (Hall of Fame) in Berlin, executed in 1882-90, and representing in numerous ideal figures "A Roman Triumphal Procession," "War," "Peace," "Walhalla," and "The Reerection of the German Empire" He also designed three stained-glass windows in the Dankeskirche at Berlin, and painted a frieze in the Berlin Academy of Arts In 1882 he was elected a member, and in 1884 senator, of the Berlin Academy, and received the title of professor Consult Donop, *Friedrich Geselschap und seine Wandgemalde in der Ruhmeshalle* (Berlin, 1890), and his biography by Von Ottingen (ib, 1898)

GESENIUS, ge-zā'nē-us, WILHELM (1786-1842) One of the greatest German Orientalists and biblical scholars He was born at Nordhausen and educated at the Gymnasium of his native town and at Helmstedt and the University of Göttingen After having been for a short time teacher in the pädagogium at Helmstedt, he became, in 1806, a theological *repetent*, or

tutor, in Göttingen, and in 1809 was appointed professor in the Gymnasium of Heiligenstadt In 1810 he received a call to Halle as assistant professor of theology and was made full professor in the following year In 1820 and again in 1835 he traveled extensively, making investigations in various libraries In 1827 he was called to Eichhorn's position at Göttingen, but declined the call In 1810-12 he published a *Hebrew and Chaldaic Dictionary of the Old Testament* In 1813-14 appeared his *Hebraisches Elementarbuch*, consisting of a Hebrew grammar and a reading book, which were also published separately This dictionary and grammar, as they have been successively revised and translated (14th ed of the lexicon ed by Buhl, 1905, 27th ed of grammar ed by Kautzsch, 1902), are still standard books of reference, not only throughout Germany, but also in Great Britain and America Of Gesenius' numerous other writings, the following may be mentioned *Kritische Geschichte der hebraischen Sprache und Schrift* (1815), *De Pentateuchi Samaritan Origine* (1815), a translation of the prophet Isaiah with commentary (1820-21), *Ausführliches grammatisch-kritisches Lesegebäude der hebraischen Sprache* (1817), and *Scripturae Linguaeque Phœnicæ Monumenta quotquot supersunt* (3 vols. 1837) His large lexicon of the Hebrew language, *Thesaurus Philologus Criticus Linguae Hebraeae et Chaldae Veteris Testamenti* (3 vols, 1829-58), which would undoubtedly have been his greatest achievement, but which was interrupted by his death, was completed in 1858 by E Rodiger Gesenius' great merit was his placing the study of Semitic languages on a sound philological basis His method of interpreting the Old Testament was rationalistic Both Semitic philology and biblical exegesis have advanced far beyond the point to which he carried them, nevertheless, his methods and principles underlie much of the work that has been done since his time and that is still being done Consult Hayne, *Gesenius, eine Erinnerung für seine Freunde* (Berlin, 1842)

GESHUR, gē'shūr 1 An Aramæan State, east of the Jordan, probably in the southern part of modern Jaulan Its northern neighbor was Maacah According to 1 Chron ii 23, the latter took certain villages belonging to the Israelitish clan of Jair in Bashan In Deut iii 14, Joshua xii 5, Geshur and Maachah are said to border on the territory of Og of Bashan It is not impossible that Ishbaal, the son of Saul (c 1033-1026 B C), held possession of Geshur (2 Sam ii 9, Pesh, Vulg), though it was subsequently independent Many scholars hold that it was of this Geshur that Talmai, David's contemporary, was King. 2 In Josh xii 2, and 1 Sam xxvii 8, a Geshur is mentioned, but it seems to have been situated in southwest Palestine This Geshur was attacked by David from Ziklag As Talmai also occurs as the name of a Hebronite giant (Judg i 10), and Maacah as the name of a concubine of Caleb (1 Chron ii 48), it is possible that King Talmai of Geshur (2 Sam iii 3), whose daughter Maacah became David's wife and Absalom's mother, may have belonged to this southern clan

GESNER, gēs'nēr, ABRAHAM (1797-1864). A Canadian geologist, born in Nova Scotia He studied medicine in London and took his degree in 1827. Eleven years later he became geologist of the Province of Nova Scotia. In 1846 he

made experiments on burning oil distilled from petroleum and in 1848-51 on asphalt and other natural products from Trinidad. The result was the discovery of an illuminating oil capable of being burned in lamps and distilled from cannel coal and bituminous shale. To this he gave the name of kerosene, which was later applied to other mineral oils used for illuminating. In 1852-62 he lived in New York City, where he established two extensive manufactories of the oil. In the latter year he returned to Halifax, where he died. His writings are *Treatise on Coal, Petroleum, and Other Distilled Oils* (1860), *Remarks on the Geology and Mineralogy of Nova Scotia, and Geology of New Brunswick and Prince Edward's Island*, articles on "The Gypsum of Nova Scotia," vol. v, "Elevations and Depressions of the Earth in North America," vol. xvii, and "Petroleum Springs in North America," vol. xviii, in the *Journal of the London Geological Society*, and, in its *Proceedings*, vol. iv, a "Geological Map of Nova Scotia."

GESNER, JOHANN MATTHIAS (1691-1761). A distinguished German classical scholar, born at Roth, near Ansbach. He studied at the University of Jena, and in 1714 published a work on the *Philopatris* ascribed to Lucian. In 1715 he became librarian and associate rector at Weimar; in 1729, rector of the Gymnasium at Ansbach, and in 1730, rector of the St. Thomas School at Leipzig, where he was associated with Johann A. Ernesti and Johann Sebastian Bach. On the foundation of the University of Göttingen he became professor of rhetoric and subsequently librarian also. He did much to bring about a revival of the study of Greek in Germany and used his influence to induce the German universities to base their instruction in Greek and Latin on the classical authors. He published editions of Quintilian (1738), Pliny the Younger (1739), Claudian (1759), and the *Scriptores Rei Rusticæ* (1735), but his greatest work is the *Novus Linguae et Eruditionis Romanæ Thesaurus* (1749). Consult: Ernesti, *Narratio de Gesnero* (Leyden, 1762), Sauppe, *Göttinger Professoren* (Gotha, 1872), Pohnert, *J. M. Gessner und sein Verhältniss zum Philanthropismus und Neuhumanismus* (Leipzig, 1898); Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

GESNER, KONRAD VON (1516-65). A Swiss naturalist, born at Zurich. He studied Greek, Latin, Hebrew, and medicine at Zurich, Strassburg, Bourges, Paris, Montpellier, and Basel, at the last place taking his medical degree. He returned in 1541 to Zurich as professor of physics and practiced in that city as physician until his death from the plague. Gesner collected and described animals and plants with the greatest zeal throughout his entire life and wrote voluminously on many subjects. His most important work is *Historia Animalium* (1551-58), in which he intended to describe every known animal. The first book treats of viviparous, the second of oviparous quadrupeds, the third of birds, and the fourth of aquatic animals. The fifth book, on serpents, and the sixth, on insects, he left incomplete. He was preparing a description of all known plants at the time of his death. Gesner was the most important naturalist of his age. He performed the useful work of bringing together all that was known of animals and plants, including those of the recently discovered countries in the New and the Old World, and,

although he made no attempt to arrange them in a natural system, his work, together with the similar work of Aldrovandi (qv), formed the basis for the fruitful investigations and generalizations of the two following centuries.

GESNERACEÆ, gēs'nēr-ā'sē-e (Neo-Lat nom pl, named in honor of Konrad von Gesner). A family of dicotyledonous plants, mostly herbs or shrubs, comprising about 80 genera and nearly 1000 species, natives of tropical and subtropical countries. The family is associated with Scrophulariaceæ and Labiate, and several other families, to form the great order Tubiflorales, which is the great assemblage of hypogynous Sympetaleæ (qv). No representatives of Gesneraceæ are natives of the United States.

GESSI, jēs'sē, ROMOLO (1829-81). An Italian explorer, born at Ravenna. After serving in the Austrian army he was sent as an officer in the service of Egypt to the Sudan, where Gordon employed him to explore the upper Nile and the Albert Nyanza, which he sailed completely around (1876). Accompanied by Matteucci, he tried to enter the country of the Gallas, but without success. In 1879-80 he put down the insurrection raised by Suleiman in southern Darfur and became Governor of the Province of Bahr-el-Ghazal. After Gordon's resignation Gessi Pasha refused to work under Raouf and resigned (1880). He died at Suez, of malarial fever, May 1, 1881, and left a volume descriptive of his adventures, *Sette anni nel Sudan egiziano* (1891, Eng trans, London, 1892).

GESSLER, gēs'lēr. An Austrian official in the forest cantons of Switzerland, according to traditions connected with William Tell (qv). His oppressive edicts and wanton cruelty so enraged the inhabitants that a conspiracy was formed against him, and he was shot by Tell in a narrow pass near Kussnacht. He is a wholly legendary character.

GESSNER, gēs'nēr, LUDWIG (1828-90). A German jurist. He was born at Axthausen and was educated at Halle, Heidelberg, and Berlin. He held important positions in the German ministries of War, State, and Foreign Affairs, and wrote on marine and international law. *Das Recht des neutralen Seehandels* (1855), *Le droit des neutres sur mer* (1865, 2d ed, 1876), *Zur Reform des Kriegs-Seerechts* (1875), "Die Staatsverträge im allgemeinen," in Holtzendorff's *Handbuch des Völkerrechts*, vol. iii (1887).

GESSNER, SALOMON (1730-88). A Swiss poet, painter, and etcher, very popular in his day as a writer of prose idylls. He was born in Zurich, April 1, 1730. His first noteworthy poem, *Lied eines Schweizer an sein bewaffnetes Mädchen* (1751), was followed by the prose poem *Daphnis* (1754), *Idyllen* (1756), and, most famous of all, *Der Tod Abels* (1758), which he called "a sort of idyllic prose pastoral." Gessner's work is throughout inspidly sweet and monotonously melodious, yet it exactly suited the taste of a generation nursed on Rousseau. The idylls had a European influence and appeared in seven languages. He died in Zurich, March 2, 1788. Gessner's *Works* were frequently published, last in 1841. There is a French translation in three volumes (1786-93). Gessner's *Life*, by Hottinger, appeared in 1796, his *Correspondence with his Son* in 1801. For Gessner's literary influence, consult Texte, *J. J. Rousseau and Literary Cosmopolitanism* (New York, 1897).

GESTA ROMANORUM, jēs'ta rō'ma-nō'rūm (Lat., The Deeds of the Romans) The title of one of the most popular collections of anecdotes in the later Middle Ages. The stories are written in Latin and supposedly are based on Roman history, though in fact there is very little actual history contained in them. Probably at an early date there were collections of stories taken from Roman history and used as illustrations for sermons. These stories were then put together for the express purpose of being moralized and finally appeared under the title of *Gesta Romanorum Moralizata*, or something similar. Many manuscripts have come down, the three earliest editions we have were printed between 1472 and 1475 and contained altogether 181 stories, which had originated, according to Oosterley, in England at the end of the thirteenth century. The stories are short and destitute of rhetorical ornament, and usually have neither dialogue nor tragic incident. Their attractiveness lies in their childlike simplicity. The stories were very widely read, were translated into many languages, and have been used by many later authors, although not always directly. Chaucer, Gower, and others owed considerable to these simple stories. Shakespeare's *King Lear* may be based upon one of the tales in the *Gesta Romanorum*, and a part of the *Merchant of Venice* may come from the same source. Schiller's *Der Gang nach dem Eisenhammer* and other examples from the German might be given. The best critical edition is that of Oosterley, *Gesta Romanorum* (London, 1894) and *Gesta Romanorum*, trans. from the Latin by C. Swan (2 vols., New York, 1905), which contains a bibliography.

GESTATION, jēs-tā'shūn (Lat. *gestatio*, from *gestare*, frequentative of *gerere*, to carry) The term applied in physiology to the period that intervenes in the mammalia between impregnation and the bringing forth of the young. The length of gestation and the number of young produced at a birth vary extremely in different mammals, but usually stand in an inverse ratio to one another. Thus, in the larger Herbivora, as, e.g., the elephant, the horse, the ox, and the camel, the female seldom produces more than one at a time, but the period of gestation is long, while in the smaller ones the progeny is numerous, but the period of gestation is only a few weeks. In the elephant the period of gestation extends over 21 or 22 months, in the giraffe it is 14 months, in the dromedary it is 12 months, in the mare upward of 11 months, in the tapir, between 10 and 11, in the cow, 9, and in many of the larger deer, somewhat more than 8 months. In the sheep and goat the period is 5 months. In the sow, which produces a numerous litter, the period is 4 months. In the Rodentia the progeny is numerous and imperfectly developed, and the period of gestation is comparatively short, in the beaver, one of the largest of the order, it is 4 months, in the rabbit and hare, from 30 to 40 days, in the dormouse, 31 days, in the squirrel and rat, 4 weeks, and in the guinea pig, 3 weeks or less. The young of the Carnivora, like the young of the Rodentia, are born with their eyes closed and in a very immature condition, and even in the larger Carnivora the period of gestation is far shorter than in the larger Ruminantia or Pachydermata; it is 6 months in the bear, 108 days in the lion (the period in this animal is stated by Van der Hoeven at 3 months), 79 days in the puma, 62 to 63 days in the dog, the wolf, and

the fox, and 55 or 56 days in the cat. Of the Marsupialia, gestation in the kangaroo lasts 39 days, in the opossum 26 days. Of the Quadrumana, the period of gestation lasts 7 months in the monkey, which bears one, rarely two, young at term. Of the Cetacea, the whale's normal pregnancy lasts 10 months. Domesticated animals breed oftener than those in a wild condition. Wild pigeons breed twice, domesticated pigeons six or more times a year.

In women, the accepted period of gestation is 275 days from insemination, or 280 days (on an average) from the last day of the previous menstruation. In a young mother the first pregnancy may be much shorter than succeeding pregnancies. Prolongation of gestation to 300 days is possible, counting from the last menstrual flow. French law admits the legitimacy of a child born 300 days after the separation of the parents, Scottish law allows 10 months, English law allows the lapse of 11 months between the death or departure of the husband and the birth of a legitimate child, in the United States it was decided, in the case of the Commonwealth *v. Hoover*, Clark (Pa.) 514 (1846), that a child born 313 days after the absence of the father began was not necessarily a bastard. See **BASTARD**.

GESTE, zhāst, CHANSONS DE. See **CHANSONS DE GESTE**.

GESTURE, GESTURE LANGUAGE. A gesture may be defined as an expressive movement, whether mimetic, pantomimic, or attitudinal, which is used to convey some thought or emotion, and we may speak of the whole body of gestures as constituting a gesture language. The study of gesture has so far been confined chiefly to mimetic and pantomimic expression, though a beginning has recently been made in the investigation of bodily attitudes. (See **EXPRESSION**, **EXPRESSIVE MOVEMENTS**.) There is much evidence in favor of the view that gesture language is the most primitive, as well as the most natural and universal, of all languages. Moreover, it is possible to trace a direct connection between gesture and speech. Indeed, since the latter is, fundamentally, movement of the vocal organs, speech may be said to have been originally gesture, the sound being at first purely accessory, and only later becoming the medium of communication. But words are far better adapted than gestures to the manifold requirements of language, and particularly to the expression of abstract thought, so that gesture, in civilized races, has largely fallen into abeyance, and its scientific study would scarcely be possible were there not remaining a few instances in which gesture language has retained something of its original value.

The first of these sources of study is the gesture language of the uninstructed deaf-mute. The finger alphabet used by instructed deaf-mutes is, of course, not a natural gesture language, it is derived from the written letters, and is a highly artificial product. The same thing may be said of any sign language which is intended to conform to a spoken language, such as, e.g., that invented by the Abbé Sicard, who attempted to construct a language of signs in which there should be a sign for every word of the spoken language, to the word order of which the gesture order should likewise conform. Similarly, the accidental or merely suggestive signs peculiar to families, one member of which happens to be a mute, are likely to

be influenced by other and normal members of the family. The most favorable condition for the development of the natural gesture is found in institutions in which a number of mutes are brought together, and in which they are allowed to communicate freely with one another without outside influence. Under these circumstances there develops a type of gesture characterized by naturalness and by freedom from convention or tradition.

The second form of gesture language is that of the North American Indian. Unlike that of the deaf-mute, this language took shape without outside influence, and throughout many generations. The Indian possessed in fact two languages, a spoken and a gesture language, the two might be used together or, if circumstances so demanded, either could be employed alone. At night, when the gesture could not be seen, speech was chosen, during the day, if on the hunt, or if safety demanded silence, communication was by gesture. Since, moreover, the Indians were divided into many races, each one with a spoken language of its own which was incomprehensible to the other, and since races frequently split up into tribes, and a tribe might develop a dialect which presently could not be understood by other tribes of the same race, it came about that, whenever two tribes or races met for trade or treaty, gesture language was resorted to as the common medium of communication. Naturally, then, gesture language was of great importance and reached a high degree of development. The gestures of the deaf-mute are renewed with every generation, those of the Indian were passed on from one generation to the next—with the result that many of them are now so wholly conventional that the Indian himself cannot explain the relation between the symbol and its meaning.

Still a third form of gesture, and one developed under different cultural conditions, is to be found in southern Europe. The gesture language of the Neapolitans is the best known. It is doubtless of ancient origin, as evidenced by early Latin writers, and by antique works of art in which are depicted gestures similar to those of the present time. Gestures may still be seen on the streets of Naples which were used in the days of Augustus. The reason for the continued employment of the gesture by these southern Italians is probably twofold. Italy has for centuries been flooded with strange languages and dialects, so that gesture serves here, as in the case of the American Indian, to furnish a common language, and again gesture, as a means of expression, is suited to the temperament of the people. At all events, the gesture language of the Neapolitans shows the effects of long centuries of convention and tradition, and has reached the highest stages of development.

A fourth and last form of gesture language, one which in comparison with the others is purely conventional, occurs in cases where a society for some reason renounces speech and employs another form of communication to take its place. An example is found in the sign language of the Cistercian monks who, except in religious exercises, were vowed to silence. Since these recluses developed no more signs than were necessary for their daily occupations, their gestures are relatively few in number; but they are sufficient to make possible a comparison with the other forms of gesture language. The

system is characterized by gestures of two kinds: some are "natural," and are therefore similar to the gestures of the un instructed deaf-mute, others are arbitrary and peculiar to the society. As a whole, the gesture language of the Cistercians gives the impression of a construction from fragments of natural gestures, and suggests a logical rather than a psychological foundation.

We have, therefore, three types of gesture language: the natural language of the deaf-mute, which has only a limited range, the more highly developed languages of the Neapolitan and of the American Indian, which show the influence of tradition, and, finally, the relatively artificial language of the Cistercian monks. All, however, are alike in that they have the natural gesture as a starting point, the differences result from manner of growth or of expansion. The Indian would have little trouble in understanding the deaf-mute, but he could comprehend the gestures of the Neapolitan only in part, on the other hand, he would learn the conventional gestures of the Neapolitan much more easily than the artificial gestures of the Cistercian, because the former have a more directly psychological origin.

From all this it is clear that in gesture language the various dialects, if we may so distinguish the different developmental forms, rather reflect differences of social condition and tradition than illustrate the kind of variation which is shown by ordinary speech. The question arises, then, as to the possibility of an etymology of gesture which shall be comparable with that of speech. We may, evidently, refer a given sign to some other and original gesture whenever in the course of social evolution the sign or its meaning has undergone some demonstrable change. In so far as the two etymologies are comparable, but in other respects the etymology of gesture is essentially different from that of speech. The latter ends when the "root" is discovered, but in gesture the search really begins when the original gesture is known, we must seek to explain the psychological meaning of this gesture and to determine its place among the expressive movements. Now, the two fundamental forms of gesture are the demonstrative and the representative, and these are also the fundamental forms of expressive movements. The demonstrative form has, in its evolution from expression of feeling to gesture language, remained essentially unchanged. The representative form, however, divides first into two subforms: the depictive, which is purely imitative, and the characteristic, which is more free and more artistic. Later, a third subform appears, derived from the others, which we may designate as the symbolic.

The great antiquity of the demonstrative gesture is grounded in the psychological conditions of its origin. When the object concerning which communication is to be made lies in the visual field, the use of the forefinger in pointing is the simplest, the most certain, and the most unequivocal means of calling attention to it, a means employed without reflection, out of the immediate intent to communicate. The child uses it for the first beginnings of communication, and it is fundamental to every type of gesture language. The pointing gesture serves to indicate not only objects, but also persons and spatial relations, if the person com-

municating wishes to indicate himself, he points to the pit of his stomach, he designates "you" by pointing to the person addressed, while the spatial ideas "up," "down," "right," "left," "back," and "front" are all indicated by pointing in the appropriate directions. Later the personal gesture is expanded to indicate parts and functions of the body, "eye" is suggested by pointing to that part, and "seeing" is suggested by first pointing to the eye and then making a pointing movement outward into space. Later also develop the demonstrative gestures for the size of objects, the right hand held out flat with the palm down, and then raised towards the level of the shoulder, signifies "great", if the hand is depressed, the gesture means "small". Finally, a spatial gesture is made to serve symbolically for a temporal idea, thus, pointing forward means "future," and pointing backward signifies "past". The developed forms of the demonstrative gesture tend to pass over into the representative form. Thus, if the object of conversation is not present, some attribute of it may be pointed out in another object which is present, or recourse may be had to characterization. "red" is indicated by pointing to the lips, and the Cistercian signifies "wine" by touching his nose.

The representative gestures are simply a further development of the imitative expressive movements, and of their two forms, the depictive and the characteristic, the former always remains purely imitative. The depictive gesture, again, appears in two varieties: the delineating, which may be described as "drawing a picture in the air", and the plastic, so called because the plasticity of the hand permits the imitation of solid objects. The delineating is the earlier type, it predominates in the natural gesture language of the deaf-mute, while in later development the hand makes quick plastic movements to represent moving objects. To illustrate the deaf-mute represents "house" by placing the two open hands together, tip to tip and at right angles, thus making a roof and gable, the Cistercian signifies "church" by first making the sign for house, and then making the sign of the cross above the roof. The gesture for "room" is the drawing of a rectangle in the air, and an "inclosure" is a circle, to represent "garden" the circle is first drawn and then the thumb and forefinger are held to the nose as in the act of smelling a flower. "Smoke" is an upward spiral movement of the forefinger to represent the rising clouds of smoke, if the smoke rises from a house, the gesture for smoke is added to that for house. The sign for "rain" is a plastic gesture made by holding up the two lump hands with the fingers pointing down. Mimetic movements are sometimes combined with delineating gestures, e.g., "sleep" is suggested by placing the head, with eyes closed, on the right hand, "death" is the gesture for sleep followed by a pointing sign to the ground. The "characteristic" form of the representative gesture reproduces only some attribute or aspect of the object. Thus, the deaf-mute gesture for "woman" is the hand placed upon the breast, that for "child" is made by rocking the right elbow in the hollow of the left hand, another and very old gesture for "child" is produced by placing the forefinger in the mouth, this is supposed to signify either sucking or silence. The use of mimetic in connection with plastic char-

acteristic gestures also appears, e.g., the pursed lips, with forefinger held up, indicate "be still" or "warning".

At its highest development the gesture becomes symbolic. As a symbol, however, it differs from the word, in that the latter symbolizes both concrete and abstract ideas, while the gesture symbolizes only abstract ideas. Furthermore, the word has always been a symbol, the gesture becomes a symbol only as the result of evolution. In many cases this evolution may easily be traced. We have already seen that the pointing gesture, which at first was used to indicate objects in the field of vision, later came to designate spatial relations, and still later temporal ideas, and it is also evident that as the representative gesture becomes characteristic it is tending in the direction of the symbolic. A complete development of this sort is seen in a Neapolitan gesture which originally meant "bull". The gesture is produced by extending the first and fourth fingers while the two middle fingers are held down by the thumb, the hand thus represents the horned head of the "bull". Later, however, this gesture came to mean "strength," the principal characteristic of the bull, still later it was employed to symbolize "danger," and finally to express the wish "to be protected from danger". But not all symbolic gestures are derived in this way, the original gesture may itself be changed to express an abstract idea. Thus the gesture for "to talk" or "to speak" is made by first touching the lips with the index finger, and then pointing out into space. If, now, this movement is straight forward, it signifies "straight talk" or "truth", the gesture, as yet unchanged, has become symbolic. When, however, it is desired to express "untruth" or "lie," the line of movement from the lips is no more straight forward, but oblique. Mimetic movements are also combined with pantomimic in symbolic gestures, a Neapolitan gesture of this kind is that showing "mistrust," although it originally meant "warning" or "have a care". The gesture consists in drawing down the lower lid of the left eye, as if to say to the person upon whom the gaze is directed, "keep your eyes open". The facial expression of strained attention intensifies the gesture, or if the expression be that of a smile or laughter, the meaning changes to that of slyness or craftiness.

So much must suffice for the classification and analysis of gesture language. It now remains to discuss its grammar and syntax. As regards the former, we may say roundly that gesture language has no grammar, there are no nouns, verbs, prepositions, or articles, no adjectives or connectives, no nominative, accusative, or dative cases. The same gesture may be made to fit into any one of a number of grammatical categories. For example, the gesture for "lie" does duty for "a lie," "to lie," "lying," and "lied", and the sign for "sleep" may be subject or object, verb or adjective, present, past, or future tense. It is clear, on the other hand, that a gesture may be used in the logical sense as subject, object, verb, or adjective, and that in a series of gestures, corresponding to a sentence in speech, we may regard one gesture as subject, another as object, etc. An examination of gesture narrative from this point of view shows that the syntax of gesture is governed by a single principle, every gesture must be intelligible either in itself or by reference to the preceding gesture.

From this principle it follows (1) that the subject precedes attribute, and (2) that the object precedes action. If, then, the deaf-mute desires to express the ideas contained in the sentence "The angry teacher struck the child," he will first make the gesture for "teacher," then that for "angry," then that for "child," and finally the sign for "struck"—"teacher, angry, child, struck." Save in certain limiting cases these two orders are sufficient for any demand of syntax which may be laid upon the gesture language.

See EXPRESSION, SIGN LANGUAGE.

GETA, jē'ta, SEPTIMIUS (189-212 A.D.) A son of Septimius Severus and brother and colleague of Caracalla. Upon his father's death he was proclaimed Emperor, with Caracalla, but in the following year was murdered by centurions at the instigation of his brother.

GETÆ, jē'te (Lat., from Gk *Γῆται*, *Getai*). An ancient warlike people, closely akin to the Daci (see DACIA), who figure in the wars of the Greeks and the Romans. At the dawn of history they inhabited the country which is now called Bulgaria. Here Darius Hystaspis encountered them in his Scythian expedition. Shortly before the time of Alexander the Great, who warred with them, the bulk of the nation had migrated northward across the Danube. They spread over a wide region, extending from the Black Sea to the plains of Hungary. The Getæ south of the Danube, in Messia, were united in a powerful realm in the time of Cæsar, but this state had only an ephemeral duration, the Roman power becoming supreme in these regions. The Getæ, as an independent people, disappear from history about the close of the first century A.D. At the time of the great migration of nations they appear to have been absorbed by the Goths, with whom they came to be erroneously identified. The Getæ are often mentioned in the literature of the Augustan era as savage and unconquerable foes.

GETHESEMANE, gēth-sēm'a-nē (Aramaic, from *gath*, a wine press + *shemen*, oil). A small farm or estate on the Mount of Olives, about $\frac{3}{4}$ of a mile from Jerusalem, and separated from it by the Kedron valley. Attached to it was a garden, or orchard, a favorite resort of Jesus and His disciples (Luke xxii 39, John xviii 1, 2), and the scene of the agony on the night before His passion (Matt xxvi 36-47; Mark xiv. 26-42, Luke xxii 39-46). The spot pointed out to modern travelers as the site of Gethsemane is admitted to be near the real location, although some think it too near Jerusalem to be Gethsemane itself. It is a place about 150 by 140 feet, inclosed by a stone wall, and contains eight very old olive trees, which are popularly supposed to have existed in the time of Jesus, though they cannot be traced farther back than the sixteenth century. The gar-

den was given its present form by the Franciscans in 1848, but a "Grotto of the Agony" is shown a little distance to the north, and is reached by a passage from the forecourt of the church of the Virgin's Tomb. The tradition is quite continuous back to the time of the Bordeaux pilgrim (333 A.D.) and Eusebius. Consult Conder, *Bible Places* (London, 1897), Thomson, *The Land and the Book*, vol. II (New York, 1880-81), Sanday, *Sacred Sites of the Gospels* (Oxford, 1903), George Adam Smith, *Jerusalem* (London, 1905).

GETTY, gēt'ti, GEORGE WASHINGTON (1819-1901). An American soldier, born in Georgetown, D.C. Upon graduation at West Point in 1840 (with Sherman and Thomas), he was commissioned second lieutenant in the Fourth Artillery. He served on the frontier during the Canadian border troubles, and, with rank of brevet captain for gallantry at Contreras and Churubusco, fought in the Mexican War. In the Civil War he served with the Army of the Potomac in the Virginia Peninsular campaign, and from the siege of Petersburg to the Confederate surrender at Appomattox, and rose to the rank of brevet major general of volunteers for services at Winchester and Fisher's Hill. In 1866 he became colonel of the Thirty-seventh Infantry, in 1877 commanded forces on the Baltimore and Ohio Railway strike, was a member of the Fitz John Porter court of inquiry, in 1882 was transferred to the Fourth Artillery, and in 1883 was retired.

GETTYSBURG, gēt'tiz-bûrg. A borough and the county seat of Adams Co., Pa., 35 miles (direct) southwest of Harrisburg, on the Western Maryland and the Gettysburg and Harrisburg railroads (Map Pennsylvania, G 8). It is situated among picturesque hills in a fertile agricultural country and is the seat of a Lutheran theological seminary, founded in 1826, and of Pennsylvania (Gettysburg) College (Lutheran), organized in 1832. The industrial establishments comprise shirt, furniture, and wrapper factories, a brick plant, planing mills, and a foundry. The borough is governed under a charter of 1853, which provides for a burgess, elected every three years, and a unicameral council. Pop., 1900, 3495, 1910, 4030. Laid out in 1780, Gettysburg (named after Gen. James Gettys, its founder) was made the county seat in 1800 and was incorporated as a borough in 1806. One of the most noted battles of the Civil War was fought here, July 1-3, 1863, a Federal army under General Meade defeating the Confederates under General Lee. (See GETTYSBURG, BATTLE OF.) The entire battlefield has been included in a national park, the sites of particular actions being marked by monuments, of which there are now over 500. On Cemetery Hill stands the National Cemetery, 17 acres in area, dedicated by President Lincoln on Nov. 19, 1863. In it there are 3629 graves, 1630 of unknown dead. From the brow of the hill rises a battle monument surmounted by a statue of Liberty and with typical basal figures of War, Peace, History, and Plenty.

GETTYSBURG, BATTLE OF. The most important and most hotly contested battle of the Civil War in America, fought July 1-3, 1863, at Gettysburg, Pa., between the Federal Army of the Potomac, numbering about 82,000 men, under General Meade, and the Confederate Army of Northern Virginia, numbering about 73,000 men, under General Lee. After the battle of Chancell-

lorsville (May 2-4) the two armies stood for some weeks facing each other across the Rappahannock at Fredericksburg, Va., General Lee taking advantage of the interval to reorganize his army and divide it into three corps, each of three divisions, which he placed under Longstreet, Ewell, and A. P. Hill respectively. This accomplished, and his army being sufficiently rested, he decided upon the invasion of Pennsylvania, hoping by this bold plan to draw Hooker,

where he threatened Harrisburg. Hooker followed along the east bank of the Rappahannock about the middle of June, and on the 25th and 26th crossed the Potomac at Edwards Ferry. On the 28th he was superseded as commander of the Army of the Potomac by General Meade, who soon selected a field of battle along Pipe Creek, on which, if possible, to concentrate his forces and meet the Confederate army. On the afternoon of June 30, however, Buford, with a

GETTYSBURG (July 1st p.m.)

then commanding the Army of the Potomac, in pursuit, to defeat the Federal army on Northern soil, to threaten and perhaps capture Washington, to secure the support or at least recognition of France and England, and to bring the war to a close, forcing from the North a recognition of the independence of the Confederacy. On June 3 he began to move, and by June 26 each of the three corps had crossed the Potomac into western Maryland, Ewell having passed over about 10 days earlier and having entered Pennsylvania,

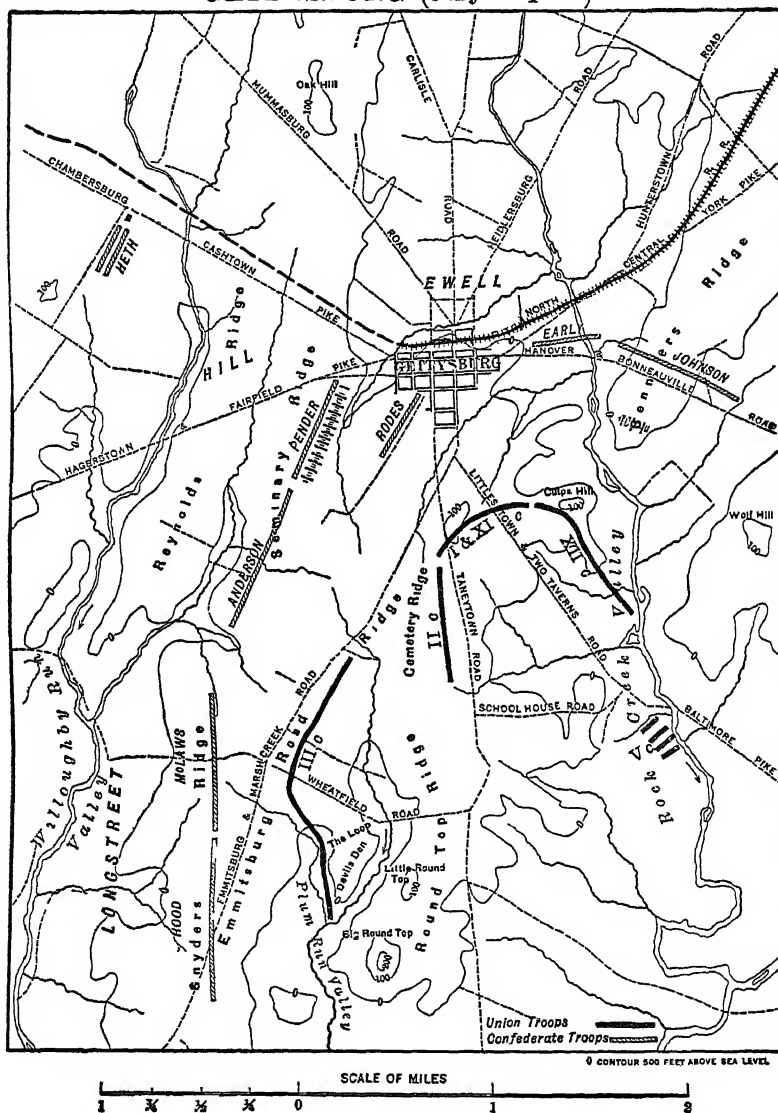

force of Federal cavalry, occupied McPherson's Ridge, beyond Seminary Ridge, west of Gettysburg, and here, at about eight o'clock on the following morning, he came in contact with Heth's division of Hill's Confederate corps, the whole Confederate army having been ordered by General Lee to concentrate at Gettysburg. Though considerably outnumbered, he stubbornly held his ground for two hours, until the arrival of General Reynolds at the head of the First Corps of the Federal army, which was reinforced about

1 P.M. by the Eleventh Corps under General Howard, the Federal troops now occupying ground north as well as west of Gettysburg.

At about one o'clock, also, General Ewell arrived with a part of his corps, the rest coming up during the afternoon, and took command on the Confederate side. At about 4 P.M. the Confederates advanced, drove the Federals from the field, and occupied the ground thus vacated. The Fed-

General Howard, General Doubleday had been in command. During the night and the following day almost the whole of each army was brought upon the field, though Pickett's division of Longstreet's corps did not arrive until towards night on the 2d. The Federal position formed a long convex line, beginning at Culp's Hill and ending at Round Top, General Sickles, with the Third Corps, occupying ground somewhat in ad-

GETTYSBURG (July 2d p.m.)

erals, under Hancock, who had superseded Howard by Meade's orders about 3:30 P.M., took up a strong position on Cemetery Ridge and Culp's Hill (south and southeast of Gettysburg), which they quickly fortified. Both sides had suffered heavily during the day in killed and wounded, and the Confederates took several thousand prisoners. The Federals sustained their severest loss in the death of General Reynolds, who was killed instantly by a Confederate sharpshooter late in the morning. Thereafter until the arrival of

vance and to the north of Little Round Top, his line following roughly the angle formed by the junction of the Emmitsburg Road and the cross-road leading therefrom to the Taneytown Road, east of the Federal position, and being "refused" towards Devil's Den. At the crossing there was a peach orchard, and between the crossing and the ridge along which the Federals were intrenched there was a wood north of the road and a wheat field south of it. The Confederate position, on the other hand, formed a much longer

and thinner concave line, with Longstreet in command on the right, A P Hill in the centre, and Ewell on the left. Lee, against the emphatic advice of Longstreet, who wished to manoeuvre the Federals out of their position and interpose the Confederate army between Meade and Washington, resolved to attack, and issued orders, accordingly, to Longstreet on the right and Ewell on the left, the former being expected

line, along Cemetery Ridge. The Confederates, however, were unable to carry Round Top and Little Round Top, the points of greatest strategic value on the Federal left. During the engagement Sickles was wounded, and General Meade added the Third Corps to the command of General Hancock. In the defense of Little Round Top, which Warren had caused to be occupied in time to repel the Confederate attack,

GETTYSBURG (July 3d a.m.)

to make the principal assault. The operations on the right did not begin until about 4 P.M. on July 2, though, according to many Southern writers, Longstreet should have delivered his attack early in the morning, when there would have been a much greater chance of Confederate success. When made, however, the attack was vigorous and spirited, and after a fierce conflict the angle at the peach orchard was broken in, and the Federals were forced to abandon their advanced position and fall back upon their main

two able Federal generals, Weed and Hazlett, were killed, and another, Vincent, was mortally wounded. On each side the losses were exceedingly heavy. Late in the afternoon, after an artillery duel lasting about an hour, Early and Johnson, both of Ewell's corps, led their divisions against the Federal right, Early assaulting Cemetery Hill and Johnson Culp's Hill. Early, with whom Rodde, commanding the other division of Ewell's corps, failed properly to cooperate, attacked with great vigor and succeeded in

breaking a line of infantry on the slopes and overrunning the Eleventh Corps and Rickett's reserve batteries, but was finally driven back, the Federals at this point thus preserving the integrity of their line. Meanwhile Johnson had met with more success at Culp's Hill, whose defenders had been greatly reduced in number in order to reenforce Sickles on the Federal left, and gained a substantial foothold, which he held overnight, but from which he was driven before noon on the following day.

On the night of the 2d Meade held a council of war, in which it was decided to hold the Federal army in the position then occupied and await further attack. On the morning of the 3d Lee ordered Longstreet to send Pickett forward to assault the Federal centre as soon as the Confederate artillery should have silenced or noticeably weakened the artillery on the other side. At 1 P.M. began a terrific artillery duel, the Confederates concentrating most of their fire from about 150 guns on Cemetery Ridge, and the Federals answering with about 70 guns, under the direction of Gen. Henry J. Hunt, chief of artillery in the Army of the Potomac. After about an hour and a half the Federal artillery, though not seriously damaged, ceased firing to save ammunition and prepare for the Confederate attack. This silence being misconstrued by the Confederate officers, Pickett's division, numbering altogether about 5000, moved forward, supported on the right by Wilcox, with about 5000 men, and on the left by Pettigrew, also with about 5000, to attack the Federal centre on Cemetery Ridge, under the immediate command of General Hancock. The charge was one of the most magnificent known in military history. Advancing steadily in three columns, in face of a destructive artillery fire, the Confederates promptly filled up the great gaps cut into their lines by the Federal shells, and encountered unflinchingly, after they had passed beyond the Emmitsburg Road, a terrific fire of canister and an enfilading cannonade from a battery on Little Round Top. When within about 300 yards of the Federal line, they met the musketry fire of the Federal infantry, which had been previously withheld. Pettigrew's advance was utterly demoralized, while Wilcox dropped behind, veering, somewhat bewildered, to the right. Pickett's men, nevertheless, pressed on, and in a hand-to-hand conflict carried the first Federal line, but were soon driven back and were finally forced in rapid retreat, their ranks being enveloped by pursuing Federals, back to the Confederate lines. As many as two-thirds of Pickett's immediate command, according to some writers, were killed, wounded, or captured. Of his three brigade commanders, Garnett was instantly killed, Armistead, who had penetrated farthest, was mortally wounded; and Kemper was severely injured. On the Federal side, General Hancock was badly wounded, and many able officers were killed. Meanwhile, on the Federal right, Gregg defeated the Confederate General Stuart in a spirited cavalry engagement, and on the Federal left, General Farnsworth was killed, while making a cavalry charge, under General Kilpatrick's orders, against Longstreet's advanced skirmishers. Both armies rested during the 4th, but on the ensuing night, under cover of the darkness and a heavy rain, Lee began his retreat towards the Potomac, which he crossed on the night of the 13th, without having been attacked by the pursuing Federal army. Dur-

ing the three days' battle the Federal army lost 3072 killed, 14,497 wounded, and 5434 captured or missing, the Confederate army, according to official reports, which, however, have been called in question, 2592 killed, 12,709 wounded, and 5150 captured or missing. The battle has been regarded as the turning point of the Civil War.

GEULINCX, *ge'links*, *Fr. pron.* zh'e'links', **ARNOLD** (1625-69). A Dutch philosopher. He was born at Antwerp, studied theology and philosophy at Louvain, and afterward remained 12 years as a successful lecturer and teacher of the classics and the Cartesian philosophy. For some reason not certainly known, but supposed to have had connection with his intended marriage and his attacks upon scholasticism, he was compelled in 1658 to leave Louvain and went to Leyden, where he became a Protestant, was married, endured many hardships due to poverty, and in 1665 was helped by an influential friend to the position of extraordinary professor in the university. Entering into this work with great zeal, he continued in it until his death. He was distinguished among the followers of Descartes, and his writings contain germs of thought that were independently developed by Spinoza and Malebranche. He gave special attention to the doctrine of the relation between the soul and the body. Descartes had already so separated extension and thought that only in the teeth of logic could he maintain against Gasendi the possibility of any interaction between them. Geulincx was more consistent. Accepting from Descartes this separation, he maintained that interaction was impossible, for one cannot be the author of any state of which one is unconscious, for man's very nature is consciousness. But a man is not conscious of the mechanism by which bodily motion is produced, hence he is not the author of bodily motion. Body and mind are like two clocks which act together, because at each instant they are adjusted by God. A physical occurrence is but the occasion on which God excites in the soul a corresponding mental state. Geulincx thus originated the theory of occasional causes. (See OCCASIONALISM.) But this theory compelled a further advance. God, who is the cause of the union of body and mind, is the sole cause in the universe. No fact

contains in itself the ground of any other. The existence of the facts is due to God, their sequence and coexistence are also due to Him. He is the ground of all that is. Apart from God the finite being has no reality. In this Geulincx led the way for Spinoza. This occasionalistic view, carried out consistently, of course leads to the doctrine that we cannot know extended reality directly, but have merely an idea of it, occasioned in us by God. Geulincx's main works were *De Virtute et Primis ejus Proprietatibus* (1665, 10 years later a posthumous edition appeared under the title *Γνώσις αεαυρόν*), *Logica suis fundamentis restituta* (1662), *Methodus Inveniendi Argumenta* (1663), *Metaphysica Vera et ad Mentem Peripateticam* (1691). A complete edition of his works in three volumes has recently been published by Land (The Hague, 1891-93). Consult Grimm, *Arnold Geulincx's Erkenntnisstheorie und Occasionalismus* (Jena, 1875), Land, *Arnold Geulincx und seine Philosophie* (The Hague, 1895), Pfeiderer, *Arnold Geulincx als Hauptvertreter der occasionalistischen Metaphysik und Ethik* (Tubingen, 1882), Van de Haeghen, *Geulincx Etude sur sa vie, sa philosophie et ses ouvrages* (Ghent, 1886), also the histories of philosophy by Windelband, Hoffding, and Falkenberg.

GEUM, *je'um* (Lat, herb bennet, avens). A genus of plants of the family Rosaceae. Two species are common natives of Great Britain and also found in the United States, common avens, or herb bennet (*Geum urbanum*), an herb about 1 to 2 feet high, and water avens (*Geum rivale*), about 1 foot high. Both of these species have the radical leaves interruptedly pinnate and lyrate and the cauline leaves ternate, but *Geum urbanum* has erect yellow flowers, and *Geum rivale* has nodding flowers of a purplish hue. The former grows in hedges and thickets, the latter in wet meadows and woods and sometimes even in alpine situations. Both are aromatic, tonic, and astringent, and are employed to restrain mucous discharges and in cases of dysentery and intermittent fever. The root of *Geum rivale* is used also in diseases of the bladder. The root of *Geum urbanum* has when fresh a clovelike taste and is used to flavor ale, for this purpose it is gathered in spring before the stem grows up. *Geum rivale* is a common plant in the United States as far west as Missouri. The chocolate root (*Geum strictum*) of North America has some reputation as a mild tonic. It was once employed in the United States in diseases of the bladder. It much resembles the British species in its leaves and has erect flowers, like those of *Geum urbanum*. Many of the species are very hardy and are used in ornamental plantings. One group has plumose styles that are very attractive after the petals have fallen. *Geum chiloense*, a native of Chile, is one of the best of this class. The genus is mainly represented in the cooler regions of the two hemispheres.

GEVAERT, *ge-vart'*, **FRANÇOIS AUGUSTE** (1828-1908). One of the foremost of musical savants. He was born at Huyse (Belgium), and received his first musical education at the Conservatory of Ghent. He became organist of the Jesuit church there (1847). In the same year he won the Grand Prix de Rome (q.v.), but received permission to postpone his journey for two years. In 1849 he began his career as an operatic composer, writing in all 12 operas. He traveled and studied in Italy, Spain, and

Germany (1850-52). In 1853 he settled in Paris, where he lived until 1871 (after 1867 as the director of the Grand Opera). In 1871 he succeeded Féty (q.v.) as director of the Conservatory at Brussels. From this time on he devoted himself to research work on the history of music. His first literary work was *Leerboek van den Gregoriaenschen zang* (1856). In 1863 appeared *Traité d'instrumentation*, completely rewritten in 1885. This is now the recognized standard (Ger trans by Riemann, 1887). Gevaert's other important works are *Histoire et théorie de la musique de l'antiquité* (1875-81), *Cours complet de l'orchestration* (1890), *Les origines du chant liturgique* (1890), in which he attacks with weighty arguments the tradition of Gregory I. (See PLAIN CHANT). A continuation of this is *La mélodie antique de l'église latine* (1895). He wrote, with Vollgraff, *Les problèmes musicaux d'Aristote* (1899-1902).

GEVELSBERG, *gä'vëls-bërk*. A town in the Prussian Province of Westphalia, 28 miles east by north of Dusseldorf. It has several fine monuments to Kaiser William I and Frederick III. It manufactures iron and steel wares, hearths, gas stoves, screws, and machinery. Pop., 1900, 13,499, 1910, 18,938.

GEWANDHAUS-CONCERTE, *ge-vant'hous kôn-tsér'te*. The name of a famous concert institute in Leipzig. The word *Gewandhaus* signifies a cloth merchants' hall, and these concerts were so called because, for want of a suitable hall, they were held in such a building. Their beginning dates back to 1743, when Doles began a series of subscription concerts which he continued until 1756, when they were interrupted by the Seven Years' War. J. A. Hiller revived the concerts in 1762 under the name of *Liebhaber-konzerte*. The orchestra, which originally consisted of but 16 performers, was increased to 30. In 1781 the burgomaster Karl Müller, together with 11 others, organized a board of directors and opened subscriptions for a series of 24 concerts to be given every season. At present the orchestra consists of about 70 performers, and 20 regular subscription concerts are given. Besides these, two benefit concerts are arranged annually—one for the orchestra pension fund, the other for the poor. When, in 1835, Mendelssohn assumed the conductorship of the Gewandhaus concerts, they soon rose to such fame and importance that for a time Leipzig was the centre of music not only of Germany, but of all Europe. Among the eminent conductors have been Doles, J. A. Hiller, Mendelssohn, F. Hiller, Gade, Rietz, Reinecke, Nikisch. Consult E. Kneschke, *Die 150jährige Geschichte der Leipziger Gewandhaus-Konzerte* (Leipzig, 1893).

GEYIKLAR. See DINEIR.

GEYSER, *gi'zër* (Icel *Geysir*, name of a famous hot spring in Iceland, from *geysa*, *gyða*, to gush). An eruptive thermal spring. A true geyser has an underground passage communicating with a source of water supply and usually terminating at the surface in a basin built up by a deposition of sinter. From the surface vent eruptions of hot water accompanied by subterranean rumblings take place at more or less regular intervals. In the powerful outbursts the water is shot upward with a loud roar to a height of 100 feet or more, this display continues for a brief time and then subsides until the next period of activity. The occurrence of geysers is limited to regions of recent volcanic activity, where hot springs and mud

springs are accompanying phenomena. The geysers of Iceland have been known for many centuries, while those of Yellowstone Park and of North Island, New Zealand, were discovered only in the last century. The most prominent examples in Iceland are the Great Geyser, the Little Geyser, and the Strokkur, the first has a pipe nearly 10 feet in diameter and erupts at intervals of a day or more, hurling the water like an immense fountain to a height exceeding 100 feet. In Yellowstone Park there are at least 70 eruptive geysers, and nearly 3000 vents of mud volcanoes, fumaroles, and hot springs, most of which occur in four basins. The surface is covered with terraces and elevations surrounding the openings, beautifully ornamented with snowy deposits of silica. Among the most remarkable of these geysers are the Giant, which throws a column of water 5 feet in diameter to a height of 200 feet, playing continuously for an hour and a half, Old Faithful, which spouts with great regularity every 65 minutes, sending the water to a height of 125 feet, Castle Geyser, issuing from a chimney 12 feet high, Excelsior, which has a basin 200 feet in diameter and spouts at intervals of eight years, the Giantess, which is said to throw a column 20 feet in diameter, the Beehive, and the Grand Geyser. The terraces of Rotomahana, New Zealand, once rivaling those of Yellowstone Park, were destroyed by a volcanic eruption in 1886.

The investigations of Bunsen in the geyser region of Iceland, confirmed as they were by laboratory experiment, have been generally accepted by geologists as affording a satisfactory

SECTION OF GEYSER

explanation of the origin and activity of eruptive thermal springs. By seepage from the surface the geyser tube (a) is filled with a column of water, which at a considerable depth receives heat from buried lava flows or other volcanic sources. When the temperature in the lower part of the tube is raised to such a point that the water boils in spite of the superincumbent column, a portion of the water is changed into steam and by expansion causes an overflow at the surface. Thus relieved of pressure, a large quantity of water flashes into steam and ejects the whole column violently into the air. If the circulation of the waters be impeded by throwing stones into the geyser tube, the eruption can often be hastened. Geysers in many cases were originally hot springs, from which they have

gradually developed by building and extending their tubes. Hot alkaline springs carry silica in solution, which is readily precipitated along the path of the flowing water, as the tube becomes longer, the difference in temperature between the upper and lower portions increases, until sufficient to cause an eruption. In course of time geysers must lose their activity and again become hot springs, or the flow of water may be entirely checked by structural changes in the tubes. Consult *United States Geological Survey of the Territories*, 5th and 6th Annual Reports (Washington, 1872-73), Bunsen, *On the Intimate Connection Existing Between the Pseudo-Volcanic Phenomena of Iceland* (London, 1848), Malfroy, *On Geyser Action at Rotomua*, (1891), Hague, *The Geology of the Yellowstone National Park* (Washington, 1904). See GEOLOGY.

GEYSERITE, g'zē-it. A name given to a variety of opal that occurs in concretionary deposits around the geysers of Iceland, New Zealand, and in the Yellowstone Park. It frequently occurs in white or grayish porous stalactitic or filamentous forms that are sometimes of great beauty. Varieties that are compact-massive or scaly-massive in appearance are sometimes found. The mineral consists essentially of silica, with from 9 to 13 per cent of water.

GEYTER, g'ītēr, JAN (JULIUS) DE (1830-1905). A Flemish poet, born at Lede. His works are distinguished by a largeness of vision and vigorous, expressive language. They include *Drie menschen van de wieg tot in het graf. Een epos uit onze tijd* (1861) (incomplete), *Geuzenlied* (1872), *Reynaart de vos*, a charming version of the old poem (1874), *Vlaanderen kunstroom* (1877), *De Wereldin Schoolcantate* (1878), *De Rijn* (1882), and the epic *Keizer Karel en het rijk der Nederlanden* (1888), his masterpiece.

GEZER. An ancient Canaanitish city. According to Josh x 33, King Hiram of Gezer fought against the invading Hebrews and maintained its independence (ib, xvi 10). Gezer (Gaz-ri) is mentioned frequently in the Tell el-Amarna letters, King Yaphu complains to the King of Egypt of the dangerous advance of the Hebrews (Habiru). In the time of Solomon (c 993-953) the city was recaptured by the King of Egypt and given to the King of Israel as his daughter's dowry (1 Kings ix 16). It became an important fortress in the days of the Maccabees (1 Macc iv 15, ix 52, xiii 43 et seq, xiv 7, 34, xv 28, 35, xvi 1, 19, 21). Simon built a palace at Gezer (Gazeira), and John Hyrcanus lived there. It became an episcopal city of Palestine I (Gadara), and the Crusaders under Baldwin IV here (Mont Gisart) defeated Saladin in 1177. The excavations carried on by the Palestine Exploration Fund, under the leadership of Macalister, at Tell Jezer, near Abu Shushéh, not far from Ramleh, the modern site of the city, have revealed five main epochs in its history. Two of them are earlier than the Israelitish occupation. The lowest stratum contains cave dwellings, with flint implements, the Canaanitish stratum above this is rich in Egyptian seals, rings, and other ornaments. The High Place, with its sacred stones, or mazzeboth, and its clay vessels containing the bodies of children, is of great interest. A stone with the inscription "boundary of Gezer" makes the identification certain. Consult. Mac-

GFRORER, g'fîr-rër, AUGUST FRIEDRICH (1803-61) A German historian. He was born at Calw, Württemberg, and much against his own inclination was put to studying theology at the University of Tübingen and kept at it till the age of 22. After traveling in Switzerland and Italy, he became tutor in theology at Tübingen in 1828 and in 1830 secured a position in the National Library at Stuttgart. His ability was very great and his energy inexhaustible, and the works he now put forth received and deserved great attention. His whole life manifested a steady evolution from liberal Protestantism to Ultramontane Catholicism. During the writing of his *Philo und die jüdisch-alexandrinische Theosophie* (1831) and the *Geschichte des Urchristentums* (1838) his views on Christianity underwent a radical transformation. During the publication of *Gustav Adolf und seine Zeit* (1835-37) he changed his point of view, and while at work on his *Allgemeine Kirchengeschichte* (1841-46), embracing the history of the Christian Church to 1305, he became convinced of the wrongfulness of the Reformation and the truth of the Catholic position. He was called to the chair of history in the Catholic University at Freiburg in 1846, showed himself an enemy of Prussia at the Frankfurt Parliament (1848-49), and became a vigorous champion of the Catholic faith, which he embraced in 1853. He died July 6, 1861. Besides the works already mentioned, he wrote *Urgeschichte des menschlichen Geschlechts* (1855), *Papst Gregor VII und sein Zeitalter* (1859-61), *Geschichte des 18 Jahrhunderts* (1862-74), *Zur Geschichte deutscher Volksrechte* (1866), *Byzantinische Geschlechter* (1872-74). The last three works were published by Weiss after the death of the author.

GHADAMES See GADAMES

GHARA, gûr'â. The name of the Sutlej, the easternmost of the five rivers of the Punjab, below its confluence with the Beas. The Ghara unites with the Chenab, which has collected the waters of the Jhelum and the Ravi, to form the Panjnad, which carries the drainage of the Punjab into the Indus. See SUTLEJ.

GHARDAYA, gar-dî'a See GARDALA

GHA'RIAL, or **GHARIYAL** See GAVIAL.

GHATS, gats. The name (see GHATS below) applied to two converging ranges of mountains, or scarpments, which run parallel with the east and west coasts of the peninsula of India, hence known as the *Eastern* and *Western Ghats*.

The Western Ghats stretch from the south side of the Tapti to Cape Comorin (Map India, B 5). Though they are generally far more continuous and distinct than the Eastern Ghats, yet they are sharply divided by the gap of Palghat-cheri, 16 miles wide, the northern section measuring 800 miles in length and the southern 200. Their general elevation appears to vary from about 3000 feet to fully 7000 feet. The peak of Dodabetta, in that portion of the Western Ghats known as the Nilgiris, is 8760 feet above sea level. The opposite faces of these mountains differ remarkably from each other. Seaward, almost perpendicular precipices, to speak generally, sink at once nearly to the level of the sea, at a distance ranging from 40 to 70 miles,

but at one place approaching within 6 miles. This maritime strip, more particularly towards the south, especially under the influence of the southwest monsoon, presents that singular feature of stagnant shallow lakes known as the "Backwaters" (See COCHIN). Landward, there is a gradual slope to the Eastern Ghats, which appear as hills near the eastern escarpment of the Deccan, a distance of from 50 to 150 miles from the Bay of Bengal (Map India, C 6). The main part of the eastern range extends, with an average height of 1500 feet, from near Orissa to Coimbatore. At Coimbatore a spur ridge connects them with the Western Ghats just north of the gap of Palghat-cheri.

GHATS (Hind *ghât*, step, Skt *ghatta*, quay, from *ghatt*, to touch, connected with *gharsh*, to rub), or, as usually written, **GHAUTS**. Structures along the banks of rivers, erected to afford easy access to bathers. They are peculiar to northern Hindustan and line the river banks in most of the great cities, more especially those situated on the Ganges. A ghat consists, in general, of a broad quay, forming the essential part of the structure, with one or more broad flights of steps leading to a long, high building, fronting the river and serving for the protection of loungers from the sun's rays. The uniformity of the long lines of steps is broken by small projections, often crowned by kiosks, which relieve the eye. Though the Ganges, being the sacred river, is par excellence the river of ghats, one of the most beautiful in Hindustan is that at Maheswar, on the Nerbudda, and though Benares prides itself upon possessing the greatest number of ghats, it is almost rivaled by Ujjain and other cities. Consult Fergusson, *History of Indian and Eastern Architecture* (rev ed, London, 1910), and Havel, *Indian Architecture* (ib, 1913).

GHAVERS See GILBERS

GHAZAL', or **GHAZEL'** (Ar, love poem, from *ghazila*, to be affectionate). An Oriental ode. It was a favorite form of lyrical composition among the Persians and corresponds in some respects to our idea of the sonnet. The ghazal consists of from 5 to 16 or 17 couplets, written in the same metre and according to fixed rules of rhyme. The opening couplet has its two lines rhyming with each other, and this rhyme is repeated in the second line of each succeeding couplet, which gives to the ghazal a uniformity that approaches monotony according to Western, but not Eastern, standards of taste. In the last two lines or couplet royal, called *makta* or *khâtimah* (close), the poet introduces his own name as a signature or envoy. Certain departures from these formal rules are found. As to subject, the burden of the ghazal is generally the praise of the poet's sweetheart, or his despair at her indifference, the beauty of the spring, the blush of the rose, the song of the nightingale, or the joys of wine and conviviality. Among the Persian poets, Hafiz (q.v.) is the most famous writer of ghazals, and a number of these have, so far as the form is concerned, been successfully rendered into English. Mention, e.g., may be made of Leaf's *Versions of Hafiz* (London, 1898), Payne's translation into English verse (ib, 1901), and Le Gallienne's *Odes from the Divan* (ib, 1905). The German poets Platen, Ruckert, and Bodenstedt have very skillfully adapted this form of composition in their "Ghaselen." On the latter, consult Remy, *Influence of India and Persia on German Poetry*

(New York, 1901) For other poets who wrote in this form of verse, consult Browne, *Literary History of Persia* (ib, 1906)

GHAZALI, ga-zā'le, ABU HAMID MOHAMMED IBN MOHAMMED AL TUSI AL SHAFTI' AL (1059-1111 A D). One of the most original thinkers and possibly the greatest theologian in the Moslem world. He was born at Tus in Khorassan and belonged to the family of Ghazala. He studied theology with the Imam al Haramain in Nishapur until 1085, when he went to Bagdad. He received an appointment as professor at the Nizamiya in 1091, but in 1095 he resigned his position in order to travel. He lived in Damascus and Jerusalem, where he visited the church of the Holy Sepulchre, and made his pilgrimage to Mecca in 1097. After several years of scholarly retirement he was appointed to a chair at Nishapur in 1105, but after some time returned to Tus and entered a Sufi convent, where he died in 1111. Ghazali submitted the philosophical views and to some extent the religious doctrines held among Moslems at his time to a searching criticism. This criticism, however, was not wholly negative, he never abandoned certain fundamental positions of Moslem dogma and of the scholasticism which he attacked. He was not a skeptic, nor a radical like Abu'l Ala al Ma'arri (q v). It was his desire to revive the religious life in Islam by bringing it back from scholastic speculation, and the intolerance and strife of rival sects, to a simple interpretation of the Koran, a wholesome fear of coming judgment, love of Allah, and fellowship with all believers. The practical tendency of his preaching, his great eloquence, the subtlety of his thought, the warmth of his religious feeling, and the mysticism so manifestly giving him spiritual satisfaction, made his influence deeply felt. He was called "the restorer of the faith," and al Suyuti said of him, "If there could be another prophet after Mohammed, it would surely be al Ghazali." There are about 70 works of Ghazali known to be preserved in manuscript form in various libraries, but few have been critically edited, printed, or translated. One of his most important books *Ihya' ulum al din* (Revival of the Religious Sciences) has been printed at Bulak and Cairo, but only parts have been translated by McDonald in *Journal of the Royal Asiatic Society* (London, 1901-02), his *Religious Attitude and Life in Islam* (Chicago, 1909), and in Hastings, *Dictionary of Religion and Ethics*, II, 677 et seq. (New York, 1910), and a summary given by Asin. His *Makasid al falasifa* (Tendencies of the Philosophies) has been published in part by Beer, and there is a Latin translation made by Gundisalvi (Venice, 1506). The continuation of this work, the famous *Tahafut al falasifa* (Destruction of the Philosophies), which called forth so spirited an answer from Averroes (q v) and had so great an influence on Jewish and Christian thought, has been printed in Cairo and Bombay, but only parts have yet been translated by De Boer, Carra de Vaux (*Muséon*, vol XVIII), and Asin. The *Risala al kudsuya* has been translated by Bauer under the title *Die Dogmatik al-Ghazali's* (Halle, 1912). An eschatological study, *al Durra al fakhra*, has been published and translated by Gautier under the title *La perle précieuse de Ghazali* (Geneva, 1878). Ghazali's important spiritual autobiography *Munkidh min al dalal* (Deliverance from Error) was printed at Constantinople,

1876, and translated by Barbier de Meynard. Consult McDonald, "Life of al Ghazali," in *Journal of American Oriental Society* (Boston, 1899), id, *Development of Muslim Theology* (New York, 1903), id, *Aspects of Islam* (ib, 1911), id, in *Enzyklopädie des Islam* (Leyden, 1914), Miguel Asin Palacios, *Algazel, dogmatico, moral, asctica* (Saragossa, 1901), Carra de Vaux, *Ghazali* (Paris, 1902), Schmolders, *Essai sur les écoles philosophiques chez les Arabes* (ib, 1842), De Boer, *Die Widersprüche der Philosophie Nach al Ghazzali und ihr Ausgleich durch Ibn Rosnd* (Strassburg, 1894), Brockelmann, *Geschichte der arabischen Literatur*, I (Weimar, 1898), Broyde, in *The Jewish Encyclopedia* (New York, 1903), Nicholson, *A Literary History of the Arabs* (London, 1907), Strecken and Horten, in *Die Religion in Geschichte und Gegenwart* (Tubingen, 1910)

GHAZAN KHAN, ga-zan' kan. See MONGOL DYNASTIES

GHAZI (gā'zā) MOHAMMED. See SHAMYL

GHAZIPUR, gā'zē-pūr'. The capital of a district of the same name in the United Provinces, British India. It extends for 2 miles along the left bank of the Ganges and is 44 miles northeast of Benares (Map India, E 4). The climate is hot and humid. Large quantities of roses are grown in the vicinity for the manufacture of rose water and attar of roses. Ghazipur is the opium depot for the United Provinces, and the large government factory occupies more than 45 acres, employing 3500 hands during the busy season. Its chief objects of interest are the remains of Chahal Situn, or Palace of Forty Pillars, mounds of masonry, a mud fort along the river front used as the customhouse, and a fine marble statue of Lord Cornwallis, who died here in 1805. Pop., 1901, 39,429, 1911, 22,165

GHAZNI, gā'z'nē, or **GHIZNI**, gī'z'nē. A city in the southeastern part of Afghanistan, over 92 miles southwest of Kabul, situated on the river Ghazni at an altitude of 7280 feet (Map Afghanistan, N 6). It is surrounded by a mud wall and derives considerable commercial importance from its position on the route between Persia and India, which latter is entered by the Gomal Pass. It has a caravan trade in fruit, wool, and skins. Pop., once 10,000, now probably not more than 4000. It is of great strategic importance, is walled, and has an old castle in the highest part of the town. A short distance from Ghazni are the ruins of Old Ghazni, once one of the finest cities of Asia, and capital of the Ghaznivides (q v). Ghazni was taken by the English under Lord Keane in 1839 and under General Nott in 1842.

GHAZNIVIDES, gā'z'nī-vidz. A celebrated Mohammedan dynasty of 21 rulers, named from their seat in Ghazni (q v). In the height of its power it possessed an empire extending from the Tigris to the Ganges and from the Sihun, or Syr-Darya, to the Indian Ocean. The founder of the line was ALP-TIGIN, a freedman of Nasr I of the Samani dynasty, who ruled over Fergana, Kashgar, and Turkestan. Alp-Tigin, born in 880, was appointed Governor of Khorassan. In 962 he took possession of the fortress of Ghazni and for 15 years successfully withstood the Samani (q v). On his death, in 976, his slave SABUK-TIGIN, who had become his son-in-law, was unanimously chosen as his successor. He was distinguished for prudence and valor as well as for humanity and justice. By him the king-

dom was extended from the Indus to Khorassan and from the Gulf of Oman to the Syr-Darya, or Sihun. His invasion of India from the northwest was the first attempted by a Moslem and is important in that it pointed the way into Hindustan. Sabuk-Tigin died in 997 and was succeeded by his younger son ISMAIL. The elder son, MAHMUD YAMIN UD-DAULAH, the most famous of the dynasty, who had been appointed Governor of Nishapur in 994, hearing of his father's death, hastened to Ghazni. He deposed Ismail and assumed the reins of government in 999, with the title of Sultan. He was a devout Moslem and vowed that every year should see him wage a holy war against the nonbelievers. In the year following he took complete possession of Khorassan and in 1001 commenced a series of at least 16 destructive inroads into Hindustan. On the 8th of Muharram (27th of November) he defeated Jaipal, King of Kabul and Lahore, near Peshawar, with immense slaughter. In 1006, while on his second expedition to India, he was recalled by the news that Ilak Khan of Kashghar, who in 999 had conquered the Samani, was ravaging Transoxania. In 1007 and 1009 Mahmud made his third and fourth expeditions into Hindustan and each time carried off an immense booty in money, jewels, and slaves. Returning to Ghazni, he made a liberal distribution from his treasures among the poor and the ministers of religion. Within the next few years he reduced Ghur, Jurjistan, and Khwarezm. In the winter of 1025-26 he was engaged in his last expedition against the Hindus, the famous expedition to Somnath in southern Gujarat, where he obtained an enormous booty. In 1029 he conquered Irak, but on April 30 of the following year he died at Ghazni, aged 63 years. At this time the Empire of Ghazni was at the summit of its glory. Mahmud of Ghazni was a great conqueror and a patron of learning, but his fanaticism and greed are dark blots on the short-lived empire which he founded as the first foreign dominion over India. Lacking in constructive statesmanship, he only attempted to attain outward order and security, so that his poorly united kingdoms began to fall asunder soon after his death. He was succeeded by a younger son, MOHAMMED, who in October of the same year was compelled to resign the sovereignty to his younger brother, MASUD I. This prince was in 1040 signally defeated by the Seljuks (qv), who had taken possession of Khorassan. Though an able and warlike prince, misfortunes crowded thickly around his declining years. He was deposed in 1040 and murdered after a few months of imprisonment. During his reign the Seljuks took possession of Balkh, Khorassan, Khwarezm, Herat, and Irak. The sovereigns who in succession reigned in Ghazni were MAUDUD (1040-48), MASUD II (1048), BAHAUD-DIN ALI (1048), ABD UR-RASHID (1049-52), TUGHRIL, the usurper (1052), and FARRUKH-ZAD (1052-59). In their reigns there is little besides internecine quarrels of Ghazni, and the encroachments of the Seljuks on the west and north. The reign of Farrukh-zad, however, shed a bright lustre over the expiring glory of Ghazni, for the Seljuk prince, Daud, who thought to take advantage of the dissensions at Ghazni and marched against it, was signally defeated by Nush-Tigin, the general of Farrukh-zad. Encouraged by this victory, the Ghaznivide forces marched into Khorassan and regained that province. On

news of this second defeat, Alp-Arslan (qv) was sent by his uncle Tughril Beg (Togrul Bey) to stop the progress of the Ghaznivides. In the battle which ensued, fortune changed sides, and Nush-Tigin was totally defeated. A treaty of peace was then concluded. Farrukh-zad was succeeded by IBRAHIM (1059-99), in whose reign there was to a certain extent a revival of the glory of the Ghaznivides, MASUD III (1099-1114), SHIRZAD (1114-15), ARSLAN (1115-18), and BAHRAM (1118-52). During the reign of this last prince the Ghuri, a tribe inhabiting the mountainous country of Ghur in Afghanistan between Ghazni and Herat, began to make inroads upon the territory of Ghazni and, growing bolder by success, attacked and took the capital itself, driving Bahram across the Indus. But on the retreat of part of the Ghuri to their own country, Bahram retook his capital and put to death the Ghuri prince, Saif ud-Din Suri. Learning this, the brother of the prince, Ala ud-Din Husain, hastened from Ghur and, having defeated Bahram, gave up Ghazni to be pillaged by his followers. Bahram was thus driven a second time across the Indus in 1149 and died in the following year. His son KHUSRU SHAH (1152-60) succeeded him and took up his residence in Lahore. The many attempts which he made to repossess himself of Ghazni and the surrounding territory were unsuccessful. KHUSRU MALIK (1160-86), the twenty-first and last monarch of the dynasty, occupied himself in the first part of his reign (1160-66) in extending and consolidating his Indian possessions, but subsequently his whole energies were required to repel the attacks of Shihab ud-Din Mohammed, Prince of Ghur, who, having conquered all the territory west of the Indus, now sought to drive the race of Sabuk-Tigin from their last possession. In 1184 Lahore was all that remained to Khusrul Malik, and the taking of that city by the Ghur prince in 1186 put an end to the power of the Ghaznivides. Consult Lane-Poole, *Medieval India under Mohammedan Rule* (London, 1903).

GHAZZALI See GHAZALI

GHEBERS, gē'bērs or gā'bērs, **GABERS**, **GUEBERS**, **GĀBERS** (Turk *Ghaur*, or *Ghaur*) The adherents in Persia of the ancient religion founded or reformed by Zoroaster. As worshippers of Ormazd in Iran, they correspond to the Parsis or Zoroastrian exiles in India. This small band, 8000 or 10,000 in number, stands with the Parsis to-day as the sole representatives of the faith of the Prophet of ancient Iran.

The name Gäber, Gēber, Ghēber, or Gueber, as infidel, is familiarly applied to the fire worshippers in Persia, e.g., in Moore's *Lalla Rookh* and in Byron's "Ghaur." The origin of the name is open to discussion. It is commonly explained as a derivative from the Arabic *Kāfir*, which is applied as unbeliever to all non-Mohammedans, and is supposed to have been given first to the Persian Zoroastrians by their Arab conquerors in the seventh century A.D. This explanation is doubtful on phonetic grounds. A second suggestion seeks to trace in *gaber* a tribal name or designation as implied in the name *Khabār* of the Talmud (Yebam 63 b, Gitt 17 a, etc.), and in Origen, *Contra Celsum*, 6291, who mentions Kabirs or Persians and declares that Christianity has borrowed nothing from them. If a guess might be hazarded, one might be tempted to connect the word with the Pahlavi or Middle

Persian *gabrā*, found also in Aramaic, in the sense of 'man,' which is applied to the Zoroastrians in the form *Mōg-gabrā*, or 'Magian man', and then assume a generalization in the sense of 'people, gentiles,' with the derogatory significance of unbeliever, infidel, pagan, heathen, as in the Gentiles of the Bible. Another name applied by the Mohammedans to this sect is *Ataš-parast*, or 'fire-worshippers', or again *Majūs*, 'from the Magi,' their ancient priesthood; or also *Fārsi*, i.e., Parsi, from *Fārs* or *Pārs*, the name of the Province of Persia. They designate themselves, however, as *Beh-Dinān* (those of the Good Faith).

The vicissitudes and misfortunes of these followers of the ancient Persian creed through history have been many and varied. Passing over the earlier history, to be dealt with in other articles, the battle of Nehavend (c 641 A.D.), and the final conquest of Iran by Islam, wrought a complete change in the religious tenets of Persia. The creed of Ormazd and of Zoroaster sank before the rising crescent of Allah and his Prophet, the Avesta gave place to the Koran, and the teachings of Mohammed were adopted by the Persians generally. Only a few sought freedom to worship Ormazd through flight and exile in India; these formed the later sect of the Parsis (qv). The small remnant that chose both to abide by their ancestral faith and to remain in their old home met with persecution and oppression. So great, in fact, have been the trials of these devoted Zoroastrians for their faith that within the last 200 years they have dwindled down from 100,000 to a mere handful of representatives that still preserve the early creed. Through hardships they have been reduced largely to poverty and ignorance, but, thanks to the efforts of their well-to-do brethren, the Parsis of Bombay, and the more liberal government of modern Persia, their condition has been greatly ameliorated within the last generation. Most of them that exist to-day are to be found in Yazd and Kirmān, a few also in Teheran, Ispahan, Shiraz, Urumiah, or about the eternal fire of the naphtha wells of Baku. But, scattered as they are, they have still kept alive in Iran the spark of their fading worship there, and they still maintain a high reputation for honor, uprightness, morality, and obedience to law that characterizes their more fortunate Parsi brethren in India, and they may rightly claim their title to being men of the "Good Faith." Consult Browne, *A Year amongst the Persians* (London, 1893), Sykes, *Ten Thousand Miles in Iran* (ib., 1902), Jackson, "Die iranische Religion," in vol. II of the *Grundriss der iranischen Philologie* (Strassburg, 1904). See AVESTA, PARSIS, PERSIA, ZOROASTER.

GHEE, gē (Hind *ghī*, from Skt *ghṛta*, clarified butter, pp of *ghar*, to drip). A kind of clarified butter used in many parts of India and the East, prepared from the milk of buffaloes or cows. The fresh milk is boiled for an hour or more, it is then allowed to cool, a little curdled milk added, and the curdled mass churned. When the butter begins to become rancid, which is usually the case after a few days, it is boiled till all the water and curd have separated. The fat is then removed, salted, often a little sour milk and some aromatic herbs added, and put into closed pots to be kept for use. It is said to keep for years when carefully prepared. The natives of many parts of India

use it extensively, not only as a food, but in medicine and in religious rites. Its strong odor and disagreeable flavor are not attractive to Europeans.

GHEEL, gäl. A well-known Belgian colony for the insane, 26 miles east-southeast of Antwerp (Map Belgium, C 3). It is a fertile spot, inhabited and cultivated by 10,000 or 11,000 peasants, in the midst of an extensive sandy waste, called the Campine.

Historically Gheel is noted as having been the spot where a woman of rank, said to have been of British origin, was murdered by her father in consequence of her resistance to his incestuous passion. Pilgrims, the sick, the sorrowful, and the insane, visited the tomb of the Christian virgin, the last were restored to sanity and serenity. Dymphna became the tutelary saint of those stricken in spirit, a shrine rose in her honor, which now for 10 centuries has been consecrated to the relief of mental disease and has collected around it hundreds of lunatics, chiefly of the poorer classes. Formerly the afflicted underwent a sort of novitiate in a building adjoining the church, where they were chained to the wall, and subsequently passed under the mausoleum of their patron, but now there do not appear to be any other than the ordinary ministrations of the church to which the patients belong resorted to as treatment.

About 1300 insane persons are lodged with the citizens of this community, or with 1000 heads of families, and are controlled and employed by them. Until recently this colony was merely a psychological curiosity, but the absurdity of treating all cases alike, and independently of medical aid, led to the institution of a medical staff, the erection of a hospital, and the introduction of many salutary alterations in the relations between the insane and their custodians, in classification and supervision. Consult Duval, *Gheel* (Paris, 1867), Brandes, *Die Irrencolonien* (Hanover, 1865), Ruedy, *Gheel* (Bern, 1874); Pilgrim, "A Visit to Gheel," in *American Journal of Insanity* (Utica, N. Y., 1886), Jelliffe, "A Visit to Gheel," in *Medical News* (Philadelphia, 1904).

GHEGA, gā'ga, KARL VON (1800-60). An Austrian civil engineer, born in Venice. After being engaged in hydraulic engineering and in the construction of mountain roads in northern Italy and the Tirol, he spent several years in investigating railroads in the United States and upon his return was intrusted with several important projects, such as the celebrated Semmeringbahn. He originated a number of improvements in railroad construction and wrote many important works on that subject, among which may be mentioned *Uebersicht über die Hauptfortschritte des Eisenbahnwesens 1840-50* (3d ed., 1853) and *Ueber nordamerikanischen Brückenbau und Berechnung des Tragungsvermögens der Howeschen Brücken* (1845).

GHENT, gënt (Fr *Gand*, from OFlem *Gend*). The capital of the Province of East Flanders, Belgium, and one of the most important cities of the country, situated at the confluence of the Lys with the Scheldt, 31 miles northwest of Brussels (Map Belgium, B 3). It is intersected by a number of streams and canals spanned by more than 200 bridges. The older portion with its narrow streets and gabled buildings bears a decidedly Flemish aspect and possesses numerous buildings of great historical interest, the

newer part of the city is well laid out and modern in its architecture. Ghent is about 8 miles in circumference and contains extensive gardens and promenades. The chief ecclesiastical building is the cathedral of St. Bavo, with its unpretentious Gothic exterior and splendid interior. The crypt dates from 941, the last part of the building was completed only in 1554. Besides the architectural beauty of its interior and its age, the cathedral is famous for its art treasures, among which are included the famous "Adoration of the Lamb" by the brothers Van Eyck, and one painting by Rubens. Near the cathedral stands the belfry, a square tower 375 feet high surmounted by a gilded dragon and containing a chime of 44 bells. It was begun in 1183. The church of St. Nicholas, the oldest in Ghent, was begun in the tenth century, but the larger part was constructed at the beginning of the thirteenth. It is built in the early Gothic style and has an unfinished tower with 10 turrets. The church of St. Michael, dating from the fifteenth century, is built in Gothic style and contains a number of fine pictures, including the "Crucifixion" by Van Dyck.

The secular buildings of Ghent are also of great architectural beauty and historic interest. The town hall, of which the northern façade was constructed in 1518-33 and the eastern façade in 1595-1622, is regarded as one of the finest specimens of Gothic architecture in Belgium. The Palais de Justice, completed in 1846, is also an imposing building with a Corinthian portico, and a bronze statue of Metdepennin in front. The Institut des Sciences, completed in 1890, is one of the largest public buildings of Ghent and contains the lecture rooms and laboratories of the university (see GHENT, UNIVERSITY OF). Ghent has a number of old guild houses and about 20 monasteries. Among the squares of the town the most noteworthy is the Marché du Vendredi, which has been the scene of the most important events in the history of the city. It has a bronze statue of Jacob van Artevelde in the centre and a huge cannon, known as the Dulle Griete, in the northwest corner. In the northeastern part of the city is situated the nunnery of Grand Béguinage, founded in the thirteenth century. It is surrounded by walls and moats, and with squares, church, and small houses, presents the appearance of a town in miniature. The old castle, or Oudeburg, constructed in the tenth century, was once the residence of the counts of Flanders and after a century of service as a factory has come into the possession of the city, which has restored it to its former appearance.

At the head of the educational institutions of Ghent is the university, with its four faculties of philosophy, law, natural sciences, and medicine. It has an attendance of about 500 students in these four departments, its library contains about 300,000 volumes, and there are collections of coins and copper engravings. The laboratories of the university and the faculty of natural sciences have been transferred to the Institut des Sciences, opened in 1890. Besides the university, Ghent has a Gymnasium conducted by the Jesuits, a seminary, an academy of painting, a conservatory of music, and several schools for manual training. There are also two theatres, an art museum, botanical and zoological gardens. Ghent has decreased somewhat in industrial importance since the fif-

teenth century, when it was one of the chief centres of the textile industries of Europe. It has still a considerable number of linen, woolen, and cotton mills, cotton-printing works, lace factories, tanneries, sugar refineries, cement works, breweries, etc. Among the chief products of Ghent are flowers, which are exported all over Europe. Communication facilities are excellent and commerce is still of considerable magnitude, the exports consisting chiefly of manufactured goods and agricultural products. The tonnage of vessels entering the port was, in 1893, 478,233, in 1903, 772,631, in 1911, 1,022,309. Ghent is the seat of a court of appeal, a commercial court, and a number of consular representatives. Pop., 1880, 131,431, 1900, 160,949, 1910, 164,650, 1912, 167,177.

Ghent is mentioned in history as early as the seventh century. About the year 868 Baldwin Bras-de-fer, the first Count of Flanders, built a fortress here as a defense against the Northmen. Under the counts of Flanders, Ghent continued to prosper and grow until in the fourteenth century it was able to send 20,000 men into the field. The wealth of the citizens of Ghent, and the unusual measure of liberty which they enjoyed, encouraged them to resist with arms any attempt to infringe upon their peculiar rights and privileges. This readiness to arm in their own defense is exemplified in the struggles in which Jacob and Philip van Artevelde (qqv) played a memorable part. For many years Ghent maintained a vigorous but unavailing resistance against the dukes of Burgundy, who sought to be recognized as counts of Flanders. In 1540 the city, having ventured to defy the Emperor Charles V (a native of the place), was terribly chastised. In the various wars in the Netherlands, Ghent suffered severely. For 20 years, from 1794, Ghent belonged to France and was the capital of the Department of the Scheldt. The town was occupied by the Germans after the fall of Antwerp in 1914 (see WAR IN EUROPE). Consult Gheldorf, *Histoire de la ville de Gand* (Brussels, 1846), Pirenne, *Bibliographie de l'histoire de Belgique* (Brussels, 1902), for works on separate periods and events, Fris, *Bibliographie de l'histoire de Gand jusqu'à la fin du quinzième siècle* (Ghent, 1907).

GHENT, TREATY OF A treaty between the United States and Great Britain, which ended the war between the two countries known as the "War of 1812." The American negotiators were John Quincy Adams, James A. Bayard, Henry Clay, Jonathan Russell, and Albert Gallatin. Of these Bayard and Gallatin had been sent to St. Petersburg in 1813, to join Adams in action upon Russia's offer of mediation, under express instructions to secure a stipulation against impressment. Russia's good offices were declined by England, while the termination of the Napoleonic wars so altered conditions that the American commissioners were given less stringent instructions both as to impressment and as to the fisheries. The British representatives were Lord Gambier, Henry Goulburn, and William Adams. After prolonged negotiations the treaty was signed by the respective commissioners on Dec. 24, 1814, was ratified by the United States Senate on Feb. 17, 1815, and was formally proclaimed by President Madison on the following day. Its main provisions were (1) restoration of all territory, places, and possessions taken by either party from the

other during the war, except certain islands, (2) Art. IV provided for the appointment of a commission to decide to which of the two powers, according to the boundary stated in the Treaty of 1783, certain islands in and near Passamaquoddy Bay belonged, and the commission failing to come to a decision, the subject was to be referred to some friendly sovereign or state, (3) Art V-VIII provided for commissions to settle the line of boundary as described in the Treaty of 1783—the commission to settle the line from the river St Croix to where the forty-fifth parallel cuts the river St Lawrence (called the Iroquois, or Cataragua, in the treaty), another to determine the middle of the water communications from that point to Lake Superior, and a third to adjust the limits from the water communications between Lakes Huron and Superior to the most northwestern point of the Lake of the Woods, and (4) Art IX bound both parties to use their best endeavors to abolish the slave trade, as being “irreconcilable with the principles of humanity and justice.” The treaty failed, however, to speak of the impressment of American seamen, the chief cause of the war, or of the claims of the United States to participate in the Newfoundland fisheries, recognized in the Treaty of 1783, or of the question as to British and American naval forces on the northern lakes, or the rights of neutrals. All these questions, especially that as to the fisheries, became the subjects of much subsequent negotiation. “Perhaps at the moment the Americans were the chief losers, but they gained their greatest triumph in referring all their disputes to be settled by time, the final negotiator, whose decision they could safely trust.” In 1910 the “American Committee for the Celebration of the One Hundredth Anniversary of Peace Among English-Speaking Peoples” was formed. Theodore Roosevelt was appointed honorary chairman. Similar committees were appointed in England, Canada, Australia, and the city of Ghent. Delegates from all these committees met in New York, May 5-9, 1913, and decided to commemorate the century of peace by erecting monuments and memorials, by establishing exchange professorships in British-American history, and by rewriting the history of the period impartially. For a brief account of the negotiations at Ghent, consult Henry Adams, *History of the United States*, vol ix (New York, 1891). For a bibliography of the subject, consult Babcock, *The Rise of American Nationality* (ib, 1906).

GHENT, UNIVERSITY OF. A Flemish university, founded by King William I of Holland in 1816. It was housed in the town hall until 1820, when the old Jesuit college was remodeled for its use. At the time of the revolution of 1830 the university was seriously crippled by the suppression of two of its four faculties, in 1835, however, these were restored. Various special schools have been, from time to time, merged in the university, which now has faculties of philosophy, science, law, and medicine. In 1913 the students numbered 1253, including 272 foreigners. As in Liège, the institution is maintained by the state. The libraries of the city and university are combined in one collection, containing over 350,000 volumes, especially rich in the history and literature of the Netherlands; there are also many valuable manuscripts.

GHENT, WILLIAM JAMES (1866–). An

American writer on social topics, born at Frankfort, Ind. He was for a time connected with several trade papers in New York and was thereafter a contributor to the *Independent* and other periodicals. In 1899 he was literary campaign manager for Samuel M. (“Golden Rule”) Jones, of Toledo, and in 1911 he became secretary to Victor L. Berger (qv). His publications include *Our Benevolent Feudalism* (1902), *Mass and Class* (1904), *Socialism and Success* (1910).

GHERARDESCA, gā-rar-dēs'ka. An Italian family of Tuscan origin, prominent in the thirteenth and fourteenth centuries. Their large territorial possessions lay between Pisa and Piombino. In the thirteenth century the counts of Gherardesca exercised a preponderating authority in the Republic of Pisa and were at first prominent Ghibellines, and enemies of the Visconti of Milan, who headed the Guelphs. The most celebrated of this family is Count Ugolino della Gherardesca, whose name and fate have been invested with undying interest by Dante in the *Inferno* (Canto 32). Count Ugolino, according to Ghibelline accounts, was possessed of a lawless ambition and a subtle unscrupulous spirit. Allying himself with the Guelph forces of Florence and Lucca, he compelled the Pisans in 1276 to restore him his territories, of which he had been deprived in 1274. No sooner was he reinstated in his possessions than he began to devise anew ambitious schemes. The war of the Pisans with the Genoese afforded him the opportunity he desired. In the battle of Meloria (1284) Ugolino is said to have contrived the defeat of the Pisans. He was, however, named captain general for 10 years. On account of his cruelty and vindictiveness a conspiracy was formed against him, headed by his former supporter, Ruggieri, the Archbishop of Pisa. In July, 1288, with two sons and two grandsons, he was thrown into the tower of Gualandri (the Tower of the Seven Streets), where they all perished by starvation, their dungeon has since borne the name of the Tower of Hunger. Consult Sismondi, *History of the Italian Republics* (New York, 1870), and G. del Noce, *Ugolino della Gherardesca* (Rome, 1894).

GHERARDI, gā-rar'dé, BANCROFT (1832–1903). An American naval officer. He was born in Jackson, La., served as midshipman in the navy from 1846 to 1850, and entered the Naval Academy in 1852. During the Civil War he commanded successively the *Chocorua* and the *Port Royal* of the West Gulf Blockading squadron and with the latter vessel pursued the Confederate gunboats *Morgan*, *Gaines*, and *Selma*, during the battle of Mobile Bay (Aug 5, 1864). After the war he attained the rank of rear admiral in 1887, commanded the Brooklyn Navy Yard (1887–89, 1893–94), and in 1893–94 was commander in chief of the North Atlantic squadron. He was in charge of the Columbian international naval parade and review in New York harbor in 1893 and was vice commander of the New York Military Order of Foreign Wars. He was retired from active service in 1894.

GHERARDI DELLA TESTA, gā-rar'dé dēl'ta tēs'ta, COUNT TOMMASO (1818–81). An Italian dramatic writer, born at Terricciola (Province of Pisa). He studied at the University of Pisa and fought against Austria in 1848. He wrote poems, works of prose, fiction, and more than 40 comedies, some of which are

political satires They were very successful, for the dialogue is witty and at the same time natural Among them are *Cogli uomini non si scherza*, *Il vero blasone*, *Il sistema di Giorgio*, and *Il padiglione delle mortelle* His writings are published as *Teatro Comico* (1856-66, complete ed., 1872-83) He also wrote political verse in Giusi's manner Consult *Rassegna Nazionale*, vol III (Florence, 1882), and Martini in *Nuova Antologia*, vol LXVII (Rome, 1897)

GHERKIN See CUCUMBER

GHETTO, gět'tò (of doubtful etymology, possibly from It *borghetto*, little town, dim of *borgo*, town) A Jewry Originally the name "ghetto" was applied to the quarters set apart for Jews in several cities of Italy and Bohemia, but it is now popularly used of the part of any city where Jews are numerous Both the name and the thing originated in Rome, in the time of Pope Paul IV, who first compelled the Jews to dwell within an inclosure set apart for them on the left bank of the Tiber, between Ponte Sisto and Ponte San Bartolommeo, and forbade their appearance outside of that quarter unless the men wore a yellow hat and the women a veil of the same color, to distinguish them from Christians This ghetto was removed in 1885. Other celebrated ghettos of renaissance Italy, where Jews dwelt perforce, were those of Florence (dating from 1570) and of Padua (dating from 1603) Many of the great cities of Europe and America have each a ghetto, or perhaps more than one, where only Jews dwell, or where they predominate, though Jews now inhabit these ghettos from choice and not by compulsion The ghetto has come frequently into literature from Goethe's *Dichtung und Wahrheit* to Zangwill's tales of London's Jewry and the Jewish tales of a talented group of American story-writers who picture life and character in New York's ghetto Consult Philipson, *Old European Jewries* (Philadelphia, 1894), Asch, *Bilder aus dem Ghetto* (2d ed, Berlin, 1907), Hapgood, *Spirit of the Ghetto* (Philadelphia, 1909)

GHIRBERTI, gë-bär'të, LORENZO (1378-1455) A Florentine goldsmith, and one of the chief sculptors of the early Renaissance He was the son of Cione di Ser Buonaccorso and Madonna Fiore, a lady of distinguished Florentine family His mother left his father soon after his birth, but Lorenzo found a foster father in the goldsmith Bartolo Ghiberti, with whom she lived, and who married her after her first husband's death He adopted the lad and taught him his art, but Lorenzo was more drawn to painting, which he studied, perhaps under Gherardo Starnini Fleeing from the pestilence in 1400, he went to Rimini, where he decorated a room of the palace of Carlo Malatesta He returned to Florence, notwithstanding the inducements offered by Malatesta, in response to a letter from his stepfather, in 1401 The Merchants' Guild had decided to adorn the baptistery with two new bronze doors, and the signory invited all the artists of Italy to compete. Among the competitors of Ghiberti were Brunelleschi, Jacopo della Quercia, and Niccolò d'Arrezzo The subject to be presented was a bas-relief of the "Sacrifice of Isaac"

Ghiberti was much aided by the counsel of his adopted father, who criticized his designs

and submitted them to competent citizens and strangers before the final one was cast The judges were unable to decide between Ghiberti and Brunelleschi Both of the winning designs are preserved in the Museo Nazionale, Florence, and Ghiberti's certainly appears superior in both composition and line Recognizing this, Brunelleschi generously withdrew, and on Nov 14, 1403, the commission was awarded to his rival

The doors were not completed and set up until April 14, 1424 Ghiberti made use of a number of assistants, among whom we find Donatello and Michelozzo, and was much aided by his stepfather. Twenty of the panels represent scenes from the "Life of Christ," four are devoted to the "Fathers of the Church," and four to the "Evangelists" These representations fulfill the highest demands of relief and, considered as reliefs, stand higher than those of the more celebrated east portal Among the best of the panels are the "Annunciation," the "Raising of Lazarus," the "Kiss of Judas," the "Birth of Christ," the "Purification of the Temple," and the "Youthful Christ Teaching" The figures of the "Evangelists" and of the "Fathers of the Church" are dignified and admirably draped, especially St Matthew All of the reliefs show reminiscences of the Gothic, especially in the garments, but the ornamentation is antique The corners of the panels are decorated with heads of prophets and sibyls

The north portals gave such satisfaction that, on Jan 2, 1424, Ghiberti received an order for the east gate—the famous "Paradise Portals" The subjects for these were selected from the Old Testament by Leonardo Bruni, the Chancellor of the Republic, but the designs were by Ghiberti himself The technical skill displayed in handling relief is most remarkable, the composition is faultless, and sometimes four different subjects are handled in the same fashion and yet without conflict In some panels there are as many as 100 figures, with architectural and landscape backgrounds.

Among the finest reliefs are the first, representing in one panel the "Creation of Adam," the "Creation of Eve," the "Fall of Man," and the "Expulsion from Paradise" In these the groups of angels accompanying the Creator are especially beautiful Another fine panel is "Moses upon Sinai," in which we see the expectant, terrified throng of the Israelites below, among whom is the famous group of a "Mother and Her Children" Equally beautiful are the 24 statuettes of prophets and other scriptural personages, by which the panels on each portal are surrounded There are also heads of prophets and sibyls at the angles of each relief, among which are two especially interesting ones, representing Ghiberti and his stepfather The door frame is carved with tasteful Renaissance ornamentation of foliage and animals

While executing these two great works, Ghiberti found time for others Among these were two fine bronze reliefs for the font of the baptistery of Siena (1417-27), representing episodes from the "Life of John the Baptist" Between 1432 and 1440 he also designed the bronze shrine of St Zenobius, in the cathedral of Florence, the front of which contains a beautiful relief of the "Saint Restoring a Dead Child to Life," and the back six angels in relief He also designed a grave slab for Leonardo Dati, who died in 1423, in Santa Maria Novella,

and two others in Santa Croce, all of which are much defaced by treading.

Ghiberti's chief strength, however, was in relief work on a small scale. Accordingly we find in him the most celebrated goldsmith of his day. None of his works as a goldsmith survives, but in his second *Commentary* he himself mentions the principal examples. In 1419 he made for Pope Martin V a mitre, covered with leaves of gold, among which were many different figures, and a cope button, adorned with a figure of Christ. He made another mitre in 1439 for Pope Eugenius IV, containing precious stones worth 38,000 ducats and surmounted by figures of Christ and the Virgin with angels. He also set an antique intaglio, belonging to Giovanni de' Medici, between the wings of a golden dragon crouching in a bed of ivy leaves.

In statuary Ghiberti was less successful. He executed but three statues in bronze, all of which adorned the façade of Or San Michele. "John the Baptist" (1414) is the earliest example, quite in the style of the first portal, "St. Matthew" (1420-22), cast with the aid of Michelozzo, looks like a Roman orator, "St. Stephen" (1428) is the finest of all, simple in treatment and graceful in line.

Ghiberti also figured as an architect. He is mentioned in the record of 1520 as an associate of Brunelleschi in building the cupola of the cathedral at Florence, but if we may believe Vasari, he solicited this position and perpetually annoyed his colleague by his endeavors to steal his plans. Brunelleschi feigned illness, and Ghiberti's incompetency became apparent. Whether or not this story be true, Ghiberti's *Treatise on Architecture*, which survives in manuscript form, certainly shows incompetency. As a designer for glass painting, he had greater success. Some of the finest glasses in the cathedral in Florence were carried out after his designs by Bernardo di Francesco, including those of the chapel of St. Zenobius, the middle window of the façade, and one in the drum of the cupola. As a citizen of influence, Ghiberti was selected chief magistrate of Florence and presented by the signory with a farm near Settino, in recognition of his services as an artist. He died Dec. 1, 1455, and was buried in Santa Croce.

His son and pupil, VITTORIO, was a sculptor and goldsmith of note, who assisted his father in the second door. In 1454 he made a design for the tapestry of the tribuna of the Palazzo della Signoria and in 1478 a bronze reliquary for the cathedral. Among Ghiberti's other pupils and assistants were Michelozzo, Lambertini, and Antonio Pollajuola.

Bibliography. Ghiberti himself wrote a work, the *Commentarii*, or commentaries on the art of Florence, in which he did ample justice to himself. It is preserved in manuscript form in the Biblioteca Magliabecchiana, Florence, and is best edited by Frey, *Sammlung ausgewählter Biographien Vasaris* (Berlin, 1886), and by Schlosser (ib., 1912). The other chief source for his life is the biography in Vasari, *Lives of the Painters* (10 vols., New York, 1912). There is no satisfactory modern biography of Ghiberti. Consult, however, Perkins, *Tuscan Sculptures*, vol. i (London, 1867); Scott, *Ghiberti and Donatello* (ib., 1882); Rosenberg, "Lorenzo Ghiberti," in Dohme, *Kunst und Künstler Italiens*, vol. i (Leipzig, 1878); Perkins, *Ghiberti et son école* (Paris, 1897); Raymond, *La sculpture florentine* (Florence, 1898-99); Freeman, *Ital-*

ian Sculpture of the Renaissance (London, 1901); Venturi, *Storia dell' arte italiana*, vol. vi (Rome, 1908).

GHIKA, gē'ka. A princely family which gave a number of hospodars to Moldavia and Wallachia. The founder of the house was George Ghika (1600-64), an Albanian by birth, who through the favor of his compatriot, the Grand Vizier Mohammed Kiuprili Aga, was raised to the dignity of Hospodar of Moldavia in 1658, and for a brief period (1660) was also Hospodar of Wallachia. His son, Gregory Ghika, ruled in Wallachia from 1660 to 1664 and from 1672 to 1674 and received from the Emperor Leopold I the title of Prince of the Holy Roman Empire. Of subsequent members of the family those calling for special notice are Alexander, Gregory, and Jon, though the family as a whole has been active in Rumanian affairs and always associated with the Liberal and Nationalist party.

ALEXANDER GHIKA X (1795-1862) became Hospodar of Wallachia in 1834. He founded schools for primary instruction in every village, lightened the burdens of the peasantry, began the enfranchisement of the gypsies, and assisted in the organization of a national party known as Young Rumania. Russia took alarm and gradually, under her influence, a twofold opposition was excited against him, on the part both of the extreme Liberals and of the old boyars or landed proprietors, who formed the Conservative party and were his personal enemies. After many intrigues he was removed from his office in 1842. He died in 1862. Consult Bibesco, *De la situation de la Valachie sous l'administration d'Alexandre Ghika* (Brussels, 1842).

GREGORY GHIKA (1807-57) was one of the chiefs of the Liberal opposition in Moldavia under the Hospodar Michael Sturdza (1834-49), whose selfish policy was subservient to the designs of Russia. In 1849 the Sultan appointed him Hospodar of Moldavia. Hampered during a part of his tenure by the Russian occupation, he was able to accomplish much when freed from this impediment. He organized a good police system, augmented the effective force of the militia, founded schools for superior and secondary instruction at Galatz, Hush, and elsewhere, promulgated an administrative code—the first great step towards the reform of abuses—increased municipal resources, and at his own expense built aqueducts and printed important historical manuscripts. He brought about a radical reform of the penitentiary system, the abolition of serfdom (1855) and of the censorship of the press (1856), and the establishment of foreign merchant companies for the navigation of the Pruth and the Sereth (1856). He encouraged the growth of a spirit of unity among the peoples of Moldavia and Wallachia. In 1856 Gregory was superseded in his office and went to reside in France. He committed suicide, Aug. 26, 1857, at Meudon. He left three sons, the youngest of whom was Rumanian Minister to Constantinople and died in Paris in 1902.

JON GHIKA (1817-97), a nephew of Alexander X, was born at Bucharest and after studying at Paris (1837-42) became, in the latter year, professor of mathematics and political economy at the University of Jassy. Having become a member of the national party which opposed the establishment of Russian domination in Wallachia, he was one of the leaders of the

GHIBERTI
BRONZE DOORS OF THE BAPTISTERY, FLORENCE

revolution of June, 1848, which resulted in the overthrow of the Hospodari, George Bibesco. He was sent by the short-lived provisional government as diplomatic representative to Constantinople, where his exceptional abilities gained him the favor of the Sultan, who in 1856 made him Prince of Samos. He returned to Wallachia in 1857, served in the Ministerial Council under Prince Alexander John Cuza, and was twice Premier under his successor, Prince Charles of Hohenzollern (1866-67 and 1870-71). From 1876 to 1881 he was Vice President of the Senate. From 1881 to 1889 he was Ambassador at London. He died at Bucharest, May 4, 1897. Consult Dora d'Istria, *Gli Albanesi in Rumenia storia dei principi Ghika nei secoli XVII-XIX* (Florence, 1873).

GHİKA, HELENA. See DORA D'ISTRIA.

GHILAN, or GILAN, gē-lun' A border province of Persia, occupying a narrow strip of land between the north slope of the Elburz Mountains and the Caspian Sea (Map Persia, C 4). Its area is estimated at 5000 square miles. The coast land is swampy and overgrown with thick forests which wild and ferocious animals inhabit, while the southern part partakes of the character of the Elburz region. The climate is moist and unhealthy. The well-watered and fertile coast land produces rice, cotton, tea, tobacco, peaches, figs, and other southern fruits. In the more elevated regions grain is grown and cattle are reared. Silk and oil of roses are produced extensively. The population, estimated at 200,000, is made up of the aboriginal Iramians, with Kurdish and Turkish immigrants. They speak either a Persian dialect, termed Gileki, or Tat, which is a pure Iranian tongue. In religion they are mostly Mohammedans and belong to the Shiite sect. The principal town is Resht (q v).

GHILZĀIS, gēl-zā'ēz A tribe of Pathan stock in eastern Afghanistan (q v), Aīyan by language. Consult Ratzel, *The History of Manland* (3 vols., London, 1898).

GHIRLANDAIO, gēr'lan-da'yō A family of Florentine painters. Their real family name was Bigordi, and the name Ghirlandaio or Grillandaio (garland maker) was first given to TOMMASO BIGORDI, a goldsmith, because of his skill in fashioning silver wreaths used in ladies' headdresses. His son DOMENICO (1449-94), the chief member of the family, was born in Florence and brought up in his father's trade. He studied painting and mosaic under Alesso Baldovinetti and was also influenced by Castagno and Verrocchio (q v). The earliest record of his activity is in 1475, when we find him employed in the Vatican library at Rome. The works executed there have been lost. His fresco "Call of Saints Peter and Andrew," in the Sistine Chapel, was painted in 1481-82. It is, perhaps, the best of the fifteenth-century paintings of the Sistine Chapel, being excellent in composition, with good landscape and perspective, the color is unattractive. His frescoes in the Capella Fina, in the Collegiate Church of San Gimignano, treating the "Life of St. Fina," were completed, for the most part, before 1475. They are especially remarkable for the modesty and grace of the female figures. The frescoes in Ognisanti, Florence, finished in 1480, show the painter fully developed. Of these only two paintings survive, the "Last Supper" and "St. Jerome." The former is probably the best representation of the subject painted in the fif-

teenth century and far excels his later fresco of the same subject in San Marco. His "St. Jerome" is a companion piece to Botticelli's "St. Augustine." From 1481 to 1485 Domenico was occupied in the Palazzo Vecchio, Florence, which in point of historic decoration was long the rival of the Sistine Chapel at Rome. Of all its frescoes only Ghirlandaio's survive, and of these the decorations of the chapel have been spoiled by restoration. His "St. Zenobius Enthroned" in the Sala dell' Orologio is a grand architectural composition.

On Dec. 15, 1485, he completed his masterpiece, the frescoes of the Sassetti Chapel in Santa Trinita, Florence. The figures of the donor and his family on either side of the altar are comparable in the dignity of their realism with those of the Ghent altar by the Van Eycks (q v). The frescoes represent scenes from the life of St. Francis and show the decided influence of the same subject by Giotto in Santa Croce. The heads are nearly all portraits, and the scenes are set amid views of Florence. This work is better in color and in technique than any other of his productions. Then followed the frescoes in the Tornabuoni Chapel, Santa Maria Novella, finished in 1490, which, though lacking in decorative qualities and crowded in composition, are his most celebrated works. Here, too, are figures of the donors, in lunette above is God the Father surrounded by the patron saints of Florence. Below them are the "Annunciation" and the "Baptism" on either side, typifying the subjects of the frescoes represented, i.e., the "Legend of the Virgin" and the "Life of John the Baptist." On the vaulted roof are frescoes representing the "Four Evangelists." The frescoes contain an almost incredible number of portraits in the fashionable contemporary costume of the day. 21 of the Tornabuoni and Tornabuoni families, the donors, and among other celebrities of the day, Poliziano, Marsilio Ficino, and the fair Ginevra Benci.

Domenico's easel pictures are not of equal importance, his art was more adapted to monumental fresco. Among his chief easel pictures, all of which are painted in tempera, are the altarpiece of the Sassetti Chapel (1485), now in the Uffizi, "Coronation of the Virgin" (1486), in the Palazzo Publico, Narni, the circular "Adoration of the Kings" (1487), in the Uffizi, and the altarpiece of Santa Maria degli Innocenti representing the same subject. The latter is one of his best works. A dignified work is the "Virgin Enthroned," now in the Uffizi. The altarpiece of Santa Maria Novella (1490) is divided between Berlin and Munich, and his last easel picture, "The Visitation" (1491), completed by David Ghirlandaio and Mainardi, is in the Louvre. Mention should also be made of his portrait heads, of which the best known are those of an "Old Man and Boy," in the Louvre, Giovanni Bicci de' Medici, in the Uffizi, Giovanni Tornabuoni, in the Morgan collection, New York, and several figures of popes.

Domenico passed practically all his life in Florence, where he died Jan. 11, 1494. He was the painter par excellence of Florentine life. His paintings are, in fact, genre in the guise of religion. His art represents the highest technical development of realism in the century. He united in himself in a remarkable manner all the tendencies of Florentine art, ancient and

modern, Masaccio, even Giotto, having influenced him. From the purely technical side he was one of the greatest painters that Florence ever produced. Although somewhat lacking in originality, he excelled in composition, was a fine draftsman, and, for Florence, an excellent colorist, but he lacked the one thing essential to a painter of the highest rank, viz, genius.

DAVIDE (1452-1525) and BENEDETTO GHIRLANDAIO (1458-97), brothers and pupils of Domenico, assisted their brother, but painted no independent works that survive. The mosaic of the "Annunciation" over the first north portal of the cathedral of Florence is the work of Domenico and Davide. Among Domenico's other pupils were his brother-in-law Bastiano Mainardi, Francesco Granacci (qv), and, for a brief time, Michelangelo.

RIDOLFO (1483-1561), son of Domenico, was 11 years old when his father died, but received his artistic education in his father's studio, which was conducted by Granacci and Davide Ghirlandaio. He assisted the former in some of his works, but about 1503 he came wholly under the influence of Leonardo da Vinci (qv) and painted a number of excellent works, which are hardly to be distinguished from Leonardo's. In fact, paintings formerly attributed to the latter, like the "Annunciation" in the Uffizi, the "Goldsmith" in the Pitti Palace, and the portrait of an "Old Man," in Palazzo Torregiani (Florence), are by Ridolfo. His best works of this character are the "Coronation of the Virgin" (1503), in the Louvre, and the altarpiece of San Jacopo in Ripoli (1505), and the "Betrothal of St. Catharine." Somewhat later he came under the influence of Raphael, as may be seen in his excellent portrait of an "Old Woman" (1509) in the Pitti Palace. He is reputed by Vasari to have assisted Raphael in the draperies of the "Belle Jardinière," but to have refused an invitation by him to settle at Rome. His most ambitious works are the "Coronation of the Virgin," the altarpiece of the cathedral of Prato, the "Virgin Adored by Saints," altarpiece of San Pietro Maggiore, Pistoia, and two scenes from the "Life of St. Zenobius," in the Uffizi. In later life his profession degenerated into a trade, he employed a large number of assistants, and his work became mannered and stiff.

GHISLAIN, gēs'lān'. See MÉRODE, FRANÇOIS XAVIER.

GHISLAIN, LOUIS ALBERT. See BACLET D'ALBE.

GHISLANZONI, gēs'lan-zō'nē, ANTONIO (1824-93). An Italian singer and author, born at Lecco. He was a singer in the Milan theatre, and when he lost his voice became a journalist, founded the satirical paper *L'Uomo di Pietra* (1857), and was editor of the *Gazzetta Musicale*. He wrote a number of excellent opera librettos, among them that of Verdi's *Aida*, and several novels, including *Gli artisti da teatro* (1865) and *Le donne brutte* (1870).

GHIZEH, or GIZEH, gē'zē. An Egyptian village on the left bank of the Nile opposite the island of Roda and about 3 miles from Cairo. Although now fallen into decay, it is said to have once contained magnificent palaces which in later times the Mameluke princes used as a summer residence, and it was a place of some importance in the Middle Ages. Near Ghizeh is the viceregal palace, originally built for a harem, which in 1889 became the repository of the great collection of Egyptian antiquities removed in that year from Bulak. The collection has recently been transferred to Cairo. The great pyramids (qv) lie about 5 miles west of Ghizeh. For the work of the British School of Archaeology at Ghizeh, consult Flinders Petrie, *Gizeh and Rifeh* (London, 1907).

GHIZNI, giz'nē. See GHAZNI.

GHO'GRA. See GOGRA.

GHOR, gōr. See EL-GHOR.

GHORKAR, gōr'kar (Pers. *gōrkhar*, wild ass). The name in western India and Beluchistan for the local variety of the Asiatic wild ass, which differs from the kiang in being somewhat paler, less reddish in color, and having a broader dorsal stripe. See KIANG.

GHOST DANCE. See WOVOKA.

GHOST MOTH. A moth (*Hepialus humuli*) very common in many parts of Great Britain, and of which the caterpillar, known as the "otter," often commits great ravages in hop plantations, devouring the roots of the hop. It feeds also on the roots of the nettle, buckdock, and some other plants. This moth belongs to a family (*Hepialidae*) often called swifts from their rapid flight. The male ghost moth is entirely of a satiny-white color above, the female yellowish with darker markings, both sexes are brown on the underside. They are to be seen flying about in the twilight, not unfrequently in churchyards, from which circumstance, and from the white color of the males and their sudden disappearance in the imperfect light, they derive their name. The caterpillar, which is sometimes 2 inches long, is yellowish white, with scattered hairs. It spins a large cylindrical cocoon among the roots on which it has been feeding and there becomes a chrysalis. The family is represented in North America by species harmful to the alder and other trees.

GHOSTS (AS *gäst*, OHG *geist*, Ger *Geist*; ultimately connected with OIr *goet*, wound, Skt *hēdas*, wrath). The spirits of the dead as manifested to the living. The belief in ghosts is one of the earliest of all religious phenomena and forms the foundation of many concepts and practices in cults from the most primitive faiths to the most highly spiritual. It is found in one form or another at all ages and among all peoples. To such an extent does belief in ghosts prevail that one school of comparative religion (see RELIGION, COMPARATIVE), of whom Herbert Spencer and Julius Lippert are the chief representatives, has sought to find the origin of all religion in ghost cults. This view must be regarded, however, as an erroneous, because one-sided, theory, but the importance of ghost worship as a religious factor cannot be denied, and it is certainly one of the main sources of religious belief. Its chief development is found in the widespread existence of ancestor worship, as will be explained. It is also the foundation of all eschatology (qv), or belief in future life. The notion of survival of a certain mysterious part of man, which may be called con-

GHIRLANDAIO

"NATIVITY OF THE VIRGIN MARY," FROM THE FRESCO IN THE CHURCH OF SANTA MARIA
NOVELLA, FLORENCE

veniently the soul, is found at a very early stage in religious development. Whether this belief is, and always has been, universal is a problem which may be insoluble. While many observers deny the existence of ghost belief as well as of all religious concepts among certain extremely primitive peoples, as the Andaman islanders, a prudent skepticism renders one distrustful of their conclusions, for it may be stated as a general fact that religious beliefs are particularly liable to concealment and to misinterpretation. This reticence may be due either to lack of method or to misunderstanding on the part of the investigator, or to a fear entertained by the individual questioned lest the knowledge gained from him may be used to his hurt.

The ghost concept in its most primitive form seems to be developed as follows. The phenomenon of dreams is one of the starting points. According to the reasoning of the primitive mind, the self, while the body is unconscious and inert, wanders to places familiar or even unknown, experiences pleasure and pain, converses with friends perhaps dead, and performs other actions which have no connection with the body. It is therefore a dangerous thing, in the belief of many savage tribes, to wake a sleeper suddenly, lest his soul may not return in time. Among some peoples the soul is even supposed to assume a visible shape, as that of a mouse, which comes from the sleeper's mouth. From sleep and dreams the savage proceeds by analogy to death. To him the distinction between slumber and death is one of degree rather than of kind, and it is well known how universal is the belief that sleep and death are near akin. As in slumber the soul left the body for a time, but returned to it, so in the long sleep, as the primitive mind regards it, of death, the soul is supposed to remain near the body. This belief, e.g., is found even in such developed faiths as Parsism and Mohammedanism, while other religions, as the ancient Egyptian, teach separate phases of the soul, one of which, like the Egyptian *ka*, remains near the corpse. As it is obviously impossible to keep a corpse from dissolution, and as the progress of decay renders the body more and more uninhabitable for the spirit which has left it, the soul, or the ghost as it may now be called, becomes a source of much anxiety to the kinsmen and other friends of the dead. It must be borne in mind as has been stated in the article on demonology (q v), that in primitive religion the element of terror is one of the most important factors and at first exercises a far greater influence than hope. The ghost is, then, more terrible than was the man whose body it had animated. It is no longer limited by bodily restrictions, it can traverse space with infinite speed, and may be invisible. Fortunately, and somewhat curiously, the ghost, like demons generally, is rather stupid and is also bound by certain limitations. Upon such an apparently flimsy foundation, which is, however, logical to the primitive man, are built a complicated system of mortuary customs (q v.) and the concept of immortality. The ghost, which, as has been said, delights to hover around its earthly home, is not a cheerful companion to the living and must therefore be kept away. This is accomplished by various methods, as by building a new hut for the survivors, or, more easily, by carrying the corpse out by a hole broken in the side of the dwelling, which is sub-

sequently walled up. The ghost is then unable to find its way back, and the house is safe from its invasion. The superstition here noted still survives. The so-called haunted houses and haunted rooms are cases in point, and it is important to note that it is the malignant ghosts, chiefly those who have been involved in murder or other evil acts, which especially linger around the scene of their earthly activities. The beneficent ghost plays but a small part as compared with the maleficent one. To avert the influence of maleficent ghosts, who have already been considered under the title "demonology" (q v), various forms of sacrifice and magic are employed. These ceremonies have as their primary object the satisfaction of the ghost's wants. These needs are conceived as being practically the same as they are on earth. Thus, the bow and arrows are laid with the warrior, a woman's jewelry is buried with her, and a child's toys rest beside its body. It was also common in many places, notably in Dahomey and Polynesia, to sacrifice slaves to attend their master in the spirit world, while among the ancient Germans horses and even wives (as in the Indian suttee) were often slain at the funeral pyre. It is also probable that to the wish to appease ghosts many of the elaborate mourning customs of primitive peoples may be traced. Under this category come such acts as shaving the hair, cutting the flesh, fasting, neglect of the toilet, use of unbecoming clothing, and the like. It is, of course, true that at a comparatively early time the development of civilization rendered mourning for the dead an act of affection and not of fear, but it is hard to believe that the savage who put to death the aged members of his tribe was moved by any high ideals in the beginning of mortuary customs. In line with mourning are the offerings of food, drink, clothing, and, as in China, of money to the deceased.

Thus is evolved one of the most widely spread of all cults—ancestor worship. Gradually beside the malignant ghost the benignant one appears, and by a process quite as natural. The interest which the father during his lifetime feels in his family is logically continued after his death, when the social life becomes more stable. It is also proper that his sons should be the ministers of this cult, and this explains the imperative necessity felt among many peoples for sons. If a man dies sonless, his ghost will lack care, and the ancestor cult therefore exercises a far-reaching influence on early family life. As already noted, however, this worship has its limitations. Even among civilized races, except in the comparatively rare instances where genealogical tables are constructed, men seldom know the names of their ancestors further back than the fourth generation. Translating this into terms of primitive life implies that the ghosts of remote ancestors perish, or become absorbed into a vague spirit world. This leads to the conclusion that all men do not necessarily become ghosts, or at least have but an evanescent ghosthood. It may be stated as generally true that only those men survive after death as ghosts who have been so remarkable for some reason or other as to command special attention while living. This is clearly shown by the development of the immortality concept in Judaism. (See ESCHATOLOGY.) Not in ancestor worship alone does the ghost play an important part. Many phenomena in nature worship (q v) and in the various aspects of totem

ism (qv), including tree worship and serpent worship, are explicable only by the ghost cult. On the other hand, ghost worship is deeply influenced by magic (qv), especially in the evolution of the concept of the benignant ghost, to which allusion has already been made. Magic is, in its simplest terms, a means of control over supernatural powers. As the belief in magic increases, and as by implication its power increases, the ghost becomes less and less an object of fear, and in the same degree becomes more and more a beneficent spirit, until it is evolved in many instances into a guardian angel or some like concept. In this way the ghost idea may be traced from the primitive belief in life after the death sleep, the care for such life and the avoidance of its ill will, the superhuman and generally malignant nature of that life, and its evanescence in the lapse of years, down to the benignant ghost, controlled at first by magic, which often acts as a guardian spirit, while the immortality concept, at first individual and temporary, finally becomes universal and eternal.

Consult: Spencer, *Principles of Sociology* (3d ed., 2 vols., London, 1885), Campbell, *Notes on the Spirit Basis of Belief and Custom* (Bombay, 1885), Jastrow, *The Study of Religion* (New York, 1902), O'Donnell, *Ghostly Phenomena* (London, 1910). See also DEMONOLOGY, ESCHATOLOGY, MAGIC, MORTUARY CUSTOMS, RELIGION, COMPARATIVE, SUPERSTITION, TOTEMISM, PSYCHICAL RESEARCH.

GHOSTS One of the most thrilling and powerful of Ibsen's dramas (1881). It shows the consequences of inherited evil, the ghosts that return, and gives a gloomy picture of the inevitableness of fate. Oswald Alving, son of a vicious father, whose past had been concealed, lapses into idiocy at the end, after entreating his mother to poison him when the foreseen doom shall have overtaken him.

GHURI, *gōūrē* A Mohammedan dynasty which received its name from Ghur, a rugged district of Afghanistan. Ten monarchs are included in this line, and their power lasted from about 1148 to about 1215 A.D. In 1148 ALA UD-DIN HUSAIN and his brothers, SAIF UD-DIN SURI and BAHĀ UD-DIN SAM, attacked and captured Ghazni (see GHAZNIVIDES), which was placed under Saif ud-Din. This prince was defeated by Bahram, Shah of Ghazni, in the following year and was hanged. He was succeeded by Bahā ud-Din as ruler of Ghur, who died within the year, and was followed in turn by Ala ud-Din, the "World-burner," who again captured Ghazni in 1155. His path was marked by slaughter and destruction, the only thing he was said to have spared in the city being the tomb of Mahmud, the idol of Moslem soldiers. He died in 1161 and was succeeded by his son, SAIF UD-DIN MOHAMMED, who was followed two years later by his cousin, GHIYAS UD-DIN. In 1173 the most famous prince of the line, MOHAMMED GHURI, who was to be the conqueror of northern India, captured Ghazni, which had been lost, and began his career as a warrior. He took Lahore from Khusrū Shah, the last of the Ghaznivides, in 1179, and captured it again seven years later. Mohammed's early attempts to conquer India were not successful, and he was severely defeated by the Rajah of Delhi and Ajmere, at Narain, between Delhi and Ambala, in 1191. In the following year the tables were turned, the Rajah was defeated and captured near the scene of his previous victory and put

to death. In 1193 Delhi was captured, and the first, or Turkish, dynasty of Delhi Sultans was founded there by MOHAMMED GHURI. The Sultan continued his conquests, defeating the Maharajah of Kanauj in 1194, thus extending his dominion beyond Benares. Within 10 years his slave, QUTB UD-DIN, had reduced Gujarat and Mohammed Bakhtyar had subdued Oudh, Behar, and Bengal. In 1206 Mohammed Ghuri, who kept his court at Ghazni in Afghanistan, was assassinated while asleep in his tent on the banks of the Indus and was succeeded by his nephew, GHIYAS UD-DIN MAHMUD. As so often happened at the death of an Oriental conqueror, the Empire was broken up, and the dead Emperor's slave, QUTB UD-DIN, was crowned Emperor of Delhi at Lahore and began a career of conquest, extending his sway to the Brahmaputra River. The reigns of the Ghuri dynasty after Mohammed, comprising GHIYAS UD-DIN MAHMUD (-1206-10), BAHĀ UD-DIN SAN (1210), ALA UD-DIN UTSUZ (1210-15), and ALA UD-DIN MOHAMMED (1215), are entirely without interest. Consult Lane-Poole, *Medieval India under Mohammedan Rule* (London, 1903).

GHYCZY, *g'i'tsi*, KÁLMÁN (1808-88) An Hungarian statesman, born at Komorn. He was elected to the Diet in 1843 and in 1848 appointed Undersecretary of State to Deák in the Ministry of Justice, succeeding him as Minister in September of that year. In 1861 he was elected a deputy and became President of the House. In 1865 with Tisza he formed the Left Centre party. He opposed the compromise of 1867 with Austria, but in 1874 accepted the appointment of Minister of Finance in the Bittó ministry. He was again chosen President of the House of Deputies in 1875, but retired from public life in 1879.

GIACOMELLI, *zhá'kó'mél'lé*, HECTOR (1822-1904) A French illustrator, engraver, painter of birds and insects, and collector. He was born in Paris of Italian parentage. He was a draftsman of exceptional talent, and his drawings and water colors (*gouaches*) of birds, insects, and flowers, which were his specialty, have rarely been equaled in delicacy of execution and poetic charm. Among the most celebrated of these are his illustrations for Michelet's *L'Oiseau* (1867) and *L'Insecte* (1876), for Theuriet's *Sous bois* (1883) and *Nos oiseaux* (1887), besides several original suites for magazines, and his series of initials and marginal drawings, in particular for the Doré Bible. He published in 1862 *Raffet, son œuvre lithographique et ses eaux-fortes*. Giacomelli possessed one of the finest existent collections of nineteenth-century prints.

GIACOMETTI, *ja'kó-mét'té*, PAOLO (1816-82) An Italian dramatist, born at Novi Ligure. He studied law in Genoa, after the success of his play *Rosilda* became a playwright and wrote more than 80 works of varying seriousness and literary value. For several years he was author to a strolling troupe of players, under contract to supply yearly a fixed number of plays. His most important drama is the tragedy *Sofocle* (1860). The larger number of them, all rapidly written, are built around a moral or political theme. Mistori, Rossi, and Salvini made many of them great successes. His *Works* were published in Milan (8 vols., 1859-66).

GIACOMOTTI, *zhá'kó'mó'té*, FÉLIX HENRI (1828-1909) A French historical and portrait

painter, born at Qungray (Doubs). He studied at the Ecole des Beaux-Arts and under Picot. In 1854 he won the Prix de Rome. Besides religious and principally mythological subjects, both of which he treats with equal finish and grace—the latter often with a touch of sensuality—he also painted excellent portraits. His principal works include "The Rape of Amy-mone" (1865, until recently in the Luxembourg Museum), "Agrippina Leaving the Roman Camp" (1864, Lille Museum), "Christ Blessing the Children" and "Christ in the Temple" (both in Saint-Etienne du Mont, Paris), "Apotheosis of Rubens and of Painting" (1878, ceiling piece in the Luxembourg), "Centaur and Nymph", decorative painting in the chapel of St Joseph, Notre Dame des Champs, Paris, portraits of Edmond About and the Princess Montholon (Rouen Museum).

GIAFAR, ja'far. The companion of Harun-al-Rashid, the Caliph of Bagdad, in the *Arabian Nights*.

GIANIBELLI, ja'nè-bèl'lè, or **GIAMBELLI**, FEDERIGO (c 1530-?). A famous military engineer. He was born at Mantua and, after serving for some time in Italy, proceeded to Spain and offered his services to Philip II, but abruptly quitted Madrid, and after residing some time at Antwerp, where he acquired a high reputation as a mechanician, passed over to England and entered the service of Queen Elizabeth, who granted him a pension. During the War of Independence in the Netherlands, Alexander, Duke of Parma, generalissimo of the Spanish forces, laid siege to Antwerp in 1584, whereupon Elizabeth commissioned Gianibelli to proceed to the assistance of the inhabitants. On his arrival he found that the Spaniards had built a vast bridge across the Scheldt, interrupting all communication with the sea, by which alone the city could get provisions or help. Early in 1585 Gianibelli carried out a plan for blowing up the structure by floating down rafts laden with vast quantities of explosives against it, which were to be set off by means of a mechanical contrivance. The ponderous structure was partially blown into the air, and 1000 men—among whom were some of the best Spanish officers—were killed. This achievement, however, was rendered unavailing by the failure of the Dutch admiral to relieve the town, and by the wonderful energy of the Duke of Parma, as well as the want of unity among the citizens, and Gianibelli was obliged to return to England. Here he was employed at the time of the threatened Spanish invasion in fortifying the coast line and the Thames, which he did in a very skillful manner. When the Armada appeared in the Channel, it was Gianibelli who proposed and carried out the plan of sending fire ships into the midst of the enemy, who remembered too well Gianibelli's "hell burners" of Antwerp to await their coming, and fled. Gianibelli died probably in London. The date of his death is not known.

GIANNI, jan'nè, LAPO DEI RICEVUTI. An Italian poet of the thirteenth century, a citizen of Florence and a notary. He was the friend of Dante and Guido Cavalcanti, and one of those who perfected the "sweet new style" of idealistic love poetry. Although a minor poet in the group, his work is marked by warmth of feeling and vigor of imagination. Of his verse there remain 12 ballate, two canzoni, and a doubtful sonnet. Consult G. Tropic, *Rime di Lapo Gianni* (Rome, 1872), Rossetti, *Dante and his Circle*

(London, 1874), Gabrielli, 'Lapo Gianni e la lirica predantesca,' in *Rassegna italiana* (Rome, 1887), E. Lamma, *Rime di Lapo Gianni* (1895).

GIANNONE, jan-nò'na, PIETRO (1676-1748). An eminent Italian historian, born May 7, 1676, at Ischitella, in the Neapolitan Province of Capitanata. He early distinguished himself as a lawyer at Naples and soon accumulated sufficient means to enable him to devote considerable time and energy to historical research. Early in life he had conceived the idea of writing a history of the Kingdom of Naples, and now in his villa adjoining Naples he labored for 20 years at this, his greatest historical work, which he published in 1723 in four volumes, under the title of *Storia civile del regno di Napoli*. This valuable and comprehensive work not only treats of the civil history of the kingdom, but also contains learned and critical dissertations on the laws and customs and the administrative history of Naples, from the most remote times, tracing the successive working of Greek, Roman, and Christian influences on the legislative and social institutions. His severe strictures on the spirit and practices of the modern Roman Catholic church so enraged the ecclesiastical party that Giannone was denounced and anathematized by the church. The fanaticism of the lower classes was aroused by the calumnies leveled at the writer, who was finally excommunicated by the Archbishop of Naples and forced to take refuge first at Venice and later at Vienna and other places. His history was condemned as heretical and libelous by the Pope and put on the Index. Giannone, however, was granted a small pension by the Emperor Charles VI. In 1734 he was deprived of this income and removed to Venice, whence he was expelled after being favorably received at first and forced to seek shelter in Geneva. There he composed his famous diatribe, entitled *Il trivregno*, against the papal pretensions, and proclaimed his adoption of Calvinistic doctrines. Shortly after, an emissary from the court of Turin induced Giannone to enter the Sardinian States, where he was immediately arrested, and conducted to the fortress of Turin. He passed the long years of his prison life in the pursuit of his chosen studies and retracted his change of religious opinions (1738), a step which in no way improved his condition. He died a prisoner in the fortress, March 7, 1748, after an incarceration of 12 years. His *Opere postume* (Lausanne, 1760) and his *Opere inedite*, edited by Mancini (Turin, 1859), complete the list of his historical works. An English translation of his *History of Naples* appeared in London (1729-31). Consult Pierantoni, *Autobiografia di Pietro Giannone, i suoi tempi e la sua prigionia* (Rome, 1890), and Giannone, *Lo sfiatto di Pietro Giannone da Venezia* (ib, 1892).

GIANNOTTI, jan-nòt'tè, DONATO (1492-1573). An Italian historian, born in Florence. He grew up in the Republican régime which followed the flight of the Medici from that city (1494). Upon their return (1530) he left Florence and lived most of the remainder of his life in Venice in the service of Cardinal Ridolfi, in France attached to the suite of Cardinal de Tournon, and in Rome as secretary of briefs (1571). He resembles Machiavelli in his thought and has the merit of having exactly described the forms of the governments about him and of having examined them more critically than other historians of his time. The most im-

portant of his works are *Della repubblica de Veneziani* (1540), *Della repubblica fiorentina* (1721), *Vita di Niccolò Capponi* (1620), *Discorso delle cose d'Italia*. His *Opere politiche e letterarie* were published with a biography by Vannucci (Florence, 1850). Consult Tassin, *Giannotti, sa vie, son temps et ses doctrines* (Paris, 1868), and Sanesi, *La vita e le opere di Donato Giannotti* (Pistoia, 1899).

GIANT, or SPEAR, LILY (*Doryanthes excelsa*) An Australian plant of the family Ama-

GIANT LILY

ryllidaceæ, with flowering stem 10 to 14, sometimes 20 feet high, bearing at top a cluster of large crimson blossoms. The stem is leafy, with the largest leaves near the root. This plant is found both on the mountains and along the seacoast of New South Wales and Queensland. It is of splendid beauty. The fibre of its leaves has been found to be excellent for ropes. Other species, as *Doryanthes palmeri* and *Doryanthes guilfoylei*, are fibre plants of similar habit. They yield a large quantity of white elastic fibre that is especially adapted to cordage, mats, etc. It has also been success-

fully used for making paper.

GIANT POWDER See EXPLOSIVES

GIANTS (OF *geant*, *jarant*, Fr. *géant*, from Gk *γίγας*, *gigas*, giant). Adult human beings over normal size. In each race of mankind there is a standard of average height for men and for women, and this rule extends to castes and crafts as well as to civic and urban populations. This shows how much more powerful the race has become than the individual. Tall parents often have short children, and vice versa, but the breed is uniform. The following table will show the average stature of men among the so-called gigantic races.

Race	Height in inches
Scottish, of Galloway	70.5
Scottish in general	69
Livonians	69
Irish	68.5
Norwegians	68.5
English	67.5
Polynesians	68-69
Sikhs, Punjab	68
Fulahs of Sudan	69
Kafirs	68
Cheyennes	69
Patagonians	69

Between the Akkas, a dwarfish negio people in the forests of Central Africa (height, 53 inches), and the Scottish farmers of Galloway, there is a difference of 17.5 inches, and this difference is about the same as that between the average height of the whole human race and

the tallest giants. The Wahuma of East Africa are credibly reported to average 72 inches or more in height, and statures of 78 inches certainly occur among them with remarkable frequency, however, no exact statement can be made as to their mean height until the publication of Dr Czekanowski's measurements.

The question is still mooted among ethnologists whether these differences in racial stature are due to nature or to nurture. Doubtless both causes have always been at work. It was believed among the ancients that the first men on the earth were tall and mighty and that they degenerated both in vigor and longevity. In contrast with this is the attempt to prove that the first men were dwarfish, and that the modern races of short stature are only survivals of the first men living on the outskirts of civilization.

The term "giant" is applied also to abnormally tall individuals among the different peoples of the earth. For convenience' sake it has been restricted to individuals above 200 centimeters (79 inches) in height. Stories are common among the lower civilized peoples, as well as among savage tribes, to the effect that men have lived who measured 15 feet in height. Og, King of Bashan, is said in Deuteronomy (iii 11) to have been the last of the giants. His bedstead of iron was 9 cubits, or between 11 and 13½ feet, in length. Pliny mentions the name of an Arabian giant who measured 9½ feet and also speaks of two others who were 10 feet in stature. Allowance is to be made, as in all other cases, for the imagination of the narrator. The following list of men whose real height is well known shows that it is possible for individuals to go far beyond the average of the human species, which is 65 inches.

	Inches
Magrath, Bishop Berkeley's giant	92
Patrick Cotter (1761-1804) or O'Brien	99
Charles Byrne, Irish giant	100
Topinard's Kalmuck	100
Winkelmaier, Austrian (died 1887)	103
Topinard's Finlander	112

It is conceded on the part of medical men who have studied the subject with great care that men of extraordinary stature have feeble viability. Giantism is often associated with acromegaly (qv), but is most frequently produced by excessive growth. Bishop Berkeley's experiment is interesting in this connection, since the excessive height of the man was due to special feeding. Natural giants or dwarfs, however, are abnormal, accompanied with sterility and other weaknesses.

The word "giant" does not always refer to persons of tall stature or large size, but in mythology and folklore the title is given to men of great strength or speed or prowess. It is these physical heroes that form the connecting link between the mythic world and the world of sense. It is only a short distance across a narrow boundary to the province of the Jotuns and Titans and other giants of the imagination. The Nephilim and Goliaths of the Bible are only a little way from Heracles and Typhoeus. The Cyclops Polyphemus has his legendary parallels among all peoples.

It has been suggested that the old-time and still-existing belief that mankind has degenerated, the excavation of great fossil bones in the superficial layers of the earth's crust, the discovery by explorers in the last four centuries of

THE GIANT'S CAUSEWAY
COUNTY ANTRIM, IRELAND

the taller races of the earth, whose height was exaggerated by the terrors of being in a strange country—all these combined to fix the belief in the real existence of gigantic races

Giants in Greek mythology are variously conceived, either as the sons of Gæa, Earth (Hesiod), or as a wild race of aborigines of enormous stature and proportionate strength (Homer). But neither poet refers to that tremendous conflict between the giants and the gods which, though subsequent to the overthrow of the Titans by Zeus, was often confounded with it. Their mother Earth had made them proof against all weapons of the gods, and their final defeat was due to the prowess of a mortal, Hercules. They were struck down and buried under islands and mountains, especially volcanoes. The Enceladus and Typhoeus are associated with Etna. In the colossal sculptures of the altar at Pergamum, in Asia Minor, the greatest representation of the *Gigantomachia* in ancient times, the giants appear in various shapes, some human, some monstrous, snake-footed, and winged.

The tradition about the Cyclops shows similarly diverse forms. The earliest legend makes them three in number, sons of Heaven and Earth, belonging to the race of the Titans, and yet helpers of Zeus in his struggle against their family. Each of them had one round eye in the centre of his forehead, and this element appears to be constant in the changing phases of the myth. In the *Odyssey*, however, they are gigantic and lawless shepherds living in Sicily, whose fertile soil produced for them of itself the fruits of the field. They were cannibals as well, and scoffers at Zeus. Polyphemus is described as the strongest among them and loses his single eye in the encounter with Odysseus. Later they become the assistants of Vulcan at his forge under Etna, or on the Liparian Islands, and tradition ascribed to them the work, equally suitable to their great strength, of building the massive walls of Argos, Thyrs, and Mycenæ.

Consult Taruffi, *Della macrosomia* (Milan, 1879), Bollinger, *Ueber Zwerg- und Riesenwuchs* (Berlin, 1884), Weinhold, *Die Riesen des germanischen Mythos* (Vienna, 1858), Meyer, *Die Giganten und Titanen in der antiken Sage und Kunst* (Berlin, 1887). See further bibliography in the *Index Catalogue of the Surgeon-General's Library* (Washington), under "Dwarfs and Giants", Tylor, *Early History of Mankind* (London, 1878), id., *Primitive Culture* (ib., 1891), Launoy and Roy, *Etudes biologiques sur les géants* (Paris, 1904), Wohlgenuth, *Riessen und Zwerge in der altfranzösischen erzählenden Dichtung* (Tubingen, 1906), Ranke, *Der Mensch* (Leipzig, 1912).

GIANTS, BATTLE OF THE. A term used of the battle of Melegnano (Marignano), fought on Sept. 13-14, 1515, between the allied French and Venetian armies and the Swiss allies of the Duke of Milan, in which the latter were defeated. The name originated with Trivulzio, who said that the 18 battles which he witnessed were as child's play compared with this combat of the giants. See **MELEGNANO**.

GIANT'S CAUSEWAY. A promontory on the coast of Antrim in the north of Ireland. A great outpouring of basalt took place here in the Tertiary period, and the edge of the intruded rock masses was subsequently dissected by erosion, leaving a line of perpendicular cliffs, some

of which are 500 feet high. Upon cooling the basalt assumed a columnar structure, to which is due the characteristic appearance of the Causeway. The close-fitting columns have geometrical outlines, usually hexagonal, and are divided into sections of equal length that articulate by means of convex and concave joints. The diameter of the columns ranges from 20 to 30 inches. The Causeway is divided into three portions—the Little Causeway, the Middle Causeway, and the Grand Causeway. The last has a width of from 60 to 120 feet and extends out to sea for about 500 feet, forming a natural platform which can be traversed on foot. Many of the neighboring cliffs exhibit the same columnar structure. One group of columns, from its peculiar arrangement, has been named the Saint's Organ. There are many other interesting and picturesque localities in the vicinity, including the Amphitheatre, surrounded by cliffs 350 feet high, Chimney Point, a lofty mass of rocks, and Pleaskin Head. In this vicinity the castles of Dunseverick and Dunluce, now in ruins, are perched on the top of isolated crags.

GIANT'S DANCE. An old name (*Chorea gigantum*) for Stonehenge, suggested by a legend concerning that place, which was later superseded by a second tale, related by Geoffrey of Monmouth, causing the old name to fall into comparative disuse. See **STONEHENGE**.

GIANTS' KETTLES. A popular name for deep cavities or potholes occurring in surface rocks. They are common in the glaciated regions of North America and Europe, especially on the coast of Norway, and are formed at the present time beneath the glaciers of the Alps. During the summer months the melting ice gives rise to glacial streams that run down the surface and escape into the crevasses. The erosive powers of the moving waters, carrying sand and stones, are directed by the ice passages against the rocky floor, into which deep cavities are worn. Giants' kettles are formed also in nonglaciated regions by waterfalls and rapids, wherever streams move over rocks with sufficient velocity and carry along the necessary cutting materials. Although they are commonly only a few feet in diameter or in depth, they occasionally attain much larger sizes, at Little Falls, N. Y., the Mohawk River has carved out in a hard syenite kettles that measure from 50 to 75 feet across.

GIANTS OF GUILDHALL. See **GOG AND MAGOG**.

GIAOUR, jour. A Turkish word, corrupted from the Arabic *kāfir* (unbeliever), and applied by the Turks to all who reject Mohammedanism, especially to European Christians. Though at first used exclusively as a term of reproach, its signification has been since modified, and now it is frequently employed merely as a distinctive epithet. Sultan Mahmud II forbade his subjects to apply the term "Giaour" to any European. See **GHEBERS**.

GIAOUR, THE. A narrative poem by Lord Byron, published in May, 1813. Originally only 400 lines in length, it was enlarged the same year to 1400. It is a fragment of a Turkish tale of a slave, Leila, who was thrown into the sea. Her murder was avenged by her lover, a young Venetian, the Giaour of the title. It contains the well-known lines on Greece, beginning, "He who hath bent him o'er the dead."

GIARRE, jar'ra. A rapidly growing city in Sicily, on the eastern slopes of Mount Etna,

three quarters of a mile west of its port, Riposto, and 18 miles north of Catania (Map Italy, E 6). The commercial importance of Giaire is due to its exquisite wines. Pop (commune), 1901, 26,000, 1911, 21,611

GIAVENO, ja-vi'no A city in north Italy, on the left bank of the Sangone, 20 miles west of Turin. It markets fruit, wine, potatoes, mushrooms, chestnuts, wood, and coal, and has cotton and jute factories. Pop (commune), 1901, 10,795, 1911, 11,756

GIB, gib, **ADAM** (1714-88) A Scottish anti-burgher leader. He was born at Castletown, Perthshire, April 7, 1714. He entered the University of Edinburgh, and while still an undergraduate cast his lot with Ebenezer Erskine (qv) and others of the Secession church (See PRESBYTERIANISM). He was licensed to preach in 1740 and the following year was ordained minister of the large Secession congregation of Bristo Street, Edinburgh, where he soon attained a position of prominence. In 1742 he caused some stir by the publication of an invective entitled *A Warning against Countenancing the Minustrations of George Whitefield*, and in 1745 he was almost the only minister of Edinburgh who continued to preach against rebellion while the troops of Charles Edward were in occupation of the town. When the dispute concerning the burgher's oath broke out in 1747 (see BURGHES AND ANTIBURGHES), Gib became a leader of the minority in the anti-burgher synod. It was chiefly due to his influence that it was agreed by this ecclesiastical body to summon to the bar their burgher brethren and finally to depose and excommunicate them for contumacy. From 1753 (when, after protracted litigation, he was compelled to leave the Bristo Street Church) till within a short period of his death, he preached regularly in Nicolson Street Church, which is said to have been filled every Sunday with an audience of 2000 persons. He died in Edinburgh, June 18, 1788. Among his works were *The Present Truth, a Display of the Secession Testimony* (1774), *Sacred Contemplations* (1786); and many other works dealing with the Secession. Consult McKerrow, *History of the Secession Church* (Edinburgh, 1848).

GIBARA, Hé-ba'ra An important seaport town of Cuba, situated on the north coast of the Province of Santiago de Cuba, about 25 miles north by east of Holguin, with which it is connected by rail (Map Cuba, J 5). It has a fine harbor, protected by a fort at the entrance, and carries on a large trade in fruit, especially bananas, and corn. The vicinity produces also tobacco, sugar, and coffee, and is engaged to some extent in stock raising. Timber is abundant in this region. The town has military and civil hospitals. Pop, 1907, 6170

GIBBES, gibz, **ROBERT WILSON** (1809-66) An American historian and scientist, born in Charleston, S C. He graduated in 1827 at South Carolina College (Columbia) and in 1830 at the Medical College of South Carolina (Charleston) and from 1827 to 1835 was assistant professor of chemistry, geology, and mineralogy in the former institution. In 1852-60 he edited the *Weekly Banner* and the *Daily South Carolinian*, and twice he held office as mayor of Columbia. During the Civil War he was surgeon-general of South Carolina. At the burning of Columbia, in 1865, he lost valuable collections of minerals and fossils. In addition to

many medical articles in various periodicals, notably one on "Typhoid Pneumonia" in the *American Journal of the Medical Sciences* (1842), and a volume *Cuba for Invalids* (1860), he published a *Documentary History of the American Revolution, Consisting of Letters and Papers Relating to the Contest for Liberty, Chiefly in South Carolina* (3 vols, 1853-57).

GIBBON, gib'un (Fr, of unknown origin) An East Indian anthropoid ape of the subfamily Hylobatinae, the more generalized of the two families of the higher apes, the other being Pongidae and including the oranges, gorillas, and chimpanzees. The gibbons are of a smaller size and more slender form than the simians, and their arms are so long as almost to reach the ground when the animal stands in an erect posture, there are also naked callosities on the buttocks. The head is well formed, while the lower jaw is remarkable for the great development of the chin. The canine teeth are long. The gibbons are inhabitants of forests, their long arms enabling them to swing themselves from bough to bough, which they do to wonderful distances and with extreme agility. They cannot move with ease or great rapidity on the ground, yet when they make the attempt they walk more uprightly than any other ape, stretching out their arms on each side, or even more frequently overhead, to balance themselves, with the hands hanging from the wrist. They never creep on all fours, and they sleep at night curled up in a ball. In captivity they display gentleness and a high degree of teachability and learn to eat all sorts of cooked food, though their natural diet consists mainly of fruit and birds. They have various loud cries, expressive of different emotions. Their rollicking morning chorus, a long-drawn-out ascending series of wa-hoos, is one of the most startling sounds of the Oriental jungle.

There are two genera, *Hylobates*, with about a dozen species, and *Siamanga* or, as it is now called, *Symphalangus*, containing only one, the siamang (qv), which differs from the type in having the first and second digits of the hind foot united as far as the second joint. None of the gibbons is of large size. The common white-handed or lar gibbon (*Hylobates lar*), black, with a border of gray hair around the face, is found in some parts of India and in more eastern regions. The active, or long-armed gibbon (*Hylobates agilis*), found in Sumatra, is particularly remarkable for the power which it displays of flinging itself from one tree to another, clearing at once, it is said, a distance of 40 feet. The wow-wow (*Hylobates leuciscus*) is a gibbon found in Java. The hooleck, or wa-wa (*Hylobates hooleck*), is a native of the north-eastern part of India and the neighboring parts of Assam. The fossil genus *Pithecanthropus* (qv) had much resemblance to gibbons.

Consult Hartmann, *Anthropoid Apes* (New York, 1886); Haeckel, *Aus Insulunde* (Bonn, 1901), Elliot, *A Review of the Primates* (New York, 1913). See APE, HOOLECK, SIAMANG; and Plate of ANTHROPOID APES.

DENTITION OF GIBBON

Teeth of upper and lower jaws, left side, i, incisors, c, canines, p, premolars, m, molars

GIBBON, EDWARD (1737-94) The historian of the Roman Empire, eldest son of Edward Gibbon and Judith Porten. He was born at Putney on the Thames, April 27 (O S), 1737. Of his five brothers and one sister none survived infancy. The story of his life Gibbon told in his autobiography, published after his death under the title *Memoirs of my Life and Writings* (1796). Like most thinkers, his actions are inseparable from his thoughts and the growth of his mind. He spent a sickly childhood in occasional lessons and desultory reading and discussion with his mother's sister, a woman of strong understanding and warm heart, whom he calls "the mother of my mind," and to whose kindness he ascribes not only the bringing out of his intellectual faculties, but the preservation of his life, in these critical early years. Though his education was interrupted by illness, he read enormously. From various tutors and schools he passed to Magdalen College, Oxford (1752). Here he spent 14 idle months, the chief result of which was that in his incursions into controversial theology he became a convert to the Catholic church and found himself shut out from Oxford. His father then placed him under the care of David Mallet, poet and deist, by whose philosophy Gibbon was "rather scandalized than reclaimed." He was then sent to Lausanne, in Switzerland, to board in the house of M. Pavilliard, a Calvinist minister, who judiciously suggested books and arguments to the young Gibbon and had the satisfaction of seeing him reconverted to Protestantism in the course of 18 months (1754). Subsequently his mature meditations led him away from all religions. With M. Pavilliard, whom he greatly respected, he lived for nearly five years. It was here that he began and carried out those private studies which, aided by his enormous memory, made him a master of erudition without a superior and with hardly an equal. Here, also, he fell in love with Susanne Curchod, the beautiful and accomplished daughter of a humble minister at Crassy, who afterward became Madame Necker, the mother of Madame de Stael. Gibbon's father disapproved of this "strange alliance," and Gibbon yielded to his fate.

Returning to England in 1758, he continued his studies with some interruptions. At the request of his father he finished a little work in French, begun at Lausanne, and published it under the title *Essai sur l'étude de la littérature* (1761, Eng version, 1764). In 1759 he became a captain in the Hampshire militia and afterward major and colonel. The militia being disbanded, he revisited the Continent, crossing the Alps and going on to Rome, where first came to him the thought of his great work. His plan, originally circumscribed to the decay of the city, grew, by years of reading and reflection and delay, to embrace the Empire. On the death of his father (1770) Gibbon came into possession of a comfortable fortune, settled in London (1772), and at once began writing the *Decline and Fall of the Roman Empire*. In 1774 he joined the famous Literary Club of Dr Johnson and entered Parliament, where he sat "a mute" for eight years. In 1776 the first volume of the *History* was published, and its success was immediate. Indeed, the reputation of the author was established before the religious world had time to consider and attack the famous fifteenth and sixteenth chapters, in which,

while not denying the "convincing evidence of the doctrine itself" and "the ruling providence of its great Author," Gibbon proceeds to account for the rapid growth of the early Christian Church by "secondary" or human causes. He proceeded with the history, publishing two more volumes in 1781. Two years later he returned to Lausanne, where the great work was completed. The last three volumes were published in 1788. In 1793 he returned to England to visit his friend Lord Sheffield, whose wife had just died. While in London, Gibbon died, Jan. 16, 1794, and was buried among the Sheffieldes in the church at Fletching in Sussex. Under the direction of the Royal Historical Society the centenary of his death was commemorated in London, November, 1894.

It is not easy to characterize, in a few or in many phrases, a man of so gigantic and cultivated an intellect. The *Decline and Fall* is one of the greatest achievements of human thought and erudition. It is virtually a history of the civilized world for 13 centuries, during which paganism was breaking down and Christianity was taking its place. The new facts which have come to light since Gibbon's time have shown that he was mistaken on many points, but the truth of his picture in the main has never been successfully impeached. The work also possesses style. No one to-day would imitate, if he could, the balanced structure of Gibbon's sentences. But in Gibbon, as in the Elizabethan writers, the charm lies precisely in this stately march of phrase and sentence. Byron rightly called Gibbon "the lord of irony." Of this characteristic of his genius, which gives piquancy to his style, the historian himself was aware, and he claimed to have learned it from Pascal, whose *Provincial Letters* he read almost every year. After all, Gibbon is at his best where he is most himself, as in the dignity and measured melancholy of his autobiography.

Lord Sheffield published Gibbon's *Miscellaneous Works* (2 vols, 1796, 5 vols, 1814). The autobiography contained therein was pieced together from six different manuscripts, with omissions and some additions. These six manuscripts have been published by a grandson of the elder Lord Sheffield (London, 1896). Excellent editions of the *Memoirs* have also been edited by O. F. Emerson (Boston, 1898), by Hill (London, 1900), and by H. Morley (New York, 1914). All editions of the *Decline and Fall* have been superseded by that of Bury (7 vols, 1b, 1896-1900, new ed, 1909-12). Consult also *The Letters of Gibbon*, ed by Prothero (1b, 1896), and J. A. C. Morrison, *Gibbon* ("English Men of Letters," New York, 1901).

GIBBON, JOHN (1827-96) An American soldier. He was born in Holmesburg, Pa., graduated at West Point in 1847, served in the Mexican War, at the city of Mexico and Toluca, in 1847-48, and was assistant instructor of artillery at West Point in 1854-57, and quartermaster there in 1856-59. During the Civil War he was chief of artillery in General McDowell's division from October, 1861, to May, 1862, was promoted from the rank of captain in the regular army to that of brigadier general of volunteers on May 2, 1862, participated in the second battle of Bull Run and in the battles of South Mountain and Antietam, commanded a division in the Army of the Potomac during the Rappahannock campaign, from November, 1862, to June, 1863, being wounded at Freder-

icksburg on Dec 13, 1862, commanded the Second Army Corps in the battle of Gettysburg, where he was seriously wounded, and then was commander of the Twenty-fourth Corps, in the final campaign of General Grant. On June 7, 1864, he became major general of volunteers, and on March 13, 1865, was brevetted brigadier general and major general in the regular army. Mustered out of the volunteer service in January, 1866, he reentered the regular army as colonel in July, commanded several Western posts, led the Yellowstone expedition against Sitting Bull in 1876, was wounded in the engagement of Big Hole Pass, Mont., with the Nez Percés on Aug. 9, 1877, and commanded successively several departments in the West. In 1885 he became brigadier general and put down riots in Washington Territory against the Chinese. He was retired in 1891. Gibbon published *The Artillerist's Manual* (1860, 2d ed., 1863).

GIBBONS, gib'ūnz, ABIGAIL (HOPPER) (1801-93). An American philanthropist, daughter of Isaac T. Hopper (qv). She was born in Philadelphia, taught school there and in New York, and in 1833 married James Sloan Gibbons (qv). She greatly assisted her father in the formation of the Women's Prison Association and of the Isaac T. Hopper Home for discharged prisoners. During the Civil War she rendered valuable service in the Federal camps and hospitals. On account of her prominence as an Abolitionist her home in New York was sacked in the riots of July, 1863. She helped found in New York an infant asylum (1871) and a diet kitchen (1873). Consult her *Life* by her daughter, S. H. Emerson (New York, 1897).

GIBBONS, ALFRED ST. HILL (1858-). A British explorer, born in Lancaster. In 1895-96 he made extensive explorations on the upper basin of the Zambezi River. In 1898 he ascended the Zambezi from the mouth to Lualaba in Barotseland, explored the basins of the Okavango (Kubango) and the Chobe, and, returning to Lualaba in August, 1899, set out northward across the head streams of the Zambezi and by way of Lakes Mweru, Tanganyika, Rion, and Albert Edward Nyanza to Lado on the Nile, which he reached in May, 1900. He wrote *Exploration and Hunting in Central Africa* (1898), *The Nile and Zambesi System as Waterways* (1901), *Africa from South to North through Marotseland* (1904).

GIBBONS, CHARLES (1814-85). An American lawyer, born in Wilmington, Del. He was admitted to the bar in 1838 and for several years was a member of the State Senate, of which he served as President in 1847. He was a founder of the Union League, whose constitution he formulated, was chairman of the first Republican State Committee, and during the Civil War represented the United States government on a special commission for the argument of prize cases in the Federal courts of Philadelphia.

GIBBONS, SIR GEORGE CHRISTIE (1848-). A Canadian lawyer and administrator. He was born at St. Catharines, Lincoln Co., Ontario, and was educated at Upper Canada College, Toronto. He studied law and in 1869 was called to the Ontario bar, of which he became a leader. He was a Liberal in politics. In 1905 he was appointed chairman of the Canadian section of the International Waterways Commission, which office he filled until November, 1911. He was largely instrumental in

effecting the negotiation of the International Waterways Treaty with the United States in 1909.

GIBBONS, GRINLING (1648-1721). An English sculptor and wood carver, of Dutch origin. He was probably born at Rotterdam and studied under unknown masters. He attracted the attention of Evelyn (qv), the diarist, who introduced him to Charles II. He was master carver in wood to the crown from Charles II to George I. His first important group in wood was a "Crucifixion," after Tintoretto's famous picture, which was followed by his "Stoning of St. Stephen," for the King, now at Wyvenhoe Park, Essex. Another large carving of his is in the Ducal Palace at Modena. Gibbons was much employed by Sir Christopher Wren (qv) in his churches, and in particular carved the choir stalls of St. Paul's Cathedral and the woodwork of the library of Trinity College, Cambridge. He executed many carvings for the King in the palaces of Windsor, Whitehall, and Kensington, and particularly important are the carvings at Chatsworth, made for the Duke of Devonshire, at Petworth, and at Belton House. The wooden throne at Canterbury Cathedral, executed with great delicacy and skill, is also by his hand. He also essayed sculpture in bronze and marble, but not with the same success, as is shown by his marble statues of Charles II in the Royal Exchange and Chelsea Hospital and by the bronze statue of James II at Whitehall. His work is particularly famous for the splendid groups and festoons of flowers, fruit, game, etc., in life size, and very true to nature.

GIBBONS, JAMES, CARDINAL (1834-1921). An American Roman Catholic prelate. He was born in Baltimore, July 23, 1834, and received his early education in Ireland, the former home of his family, to which he was taken in infancy. Returning to Maryland at the age of 17, he pursued his studies for the priesthood at St. Charles's College and St. Mary's Seminary. He was ordained in 1861 and after a few months of service at St. Patrick's, Baltimore, was placed in charge of St. Bridget's Church, Canton, just outside the city. Archbishop Spaulding soon discerned his gifts and brought him to the cathedral as secretary and soon made him chancellor. In 1868 he was made Vicar Apostolic of North Carolina, and to fulfill the duties of the office he was consecrated Bishop. His successful administration of this difficult work earned him promotion in 1872 to the see of Richmond, Va., and his five years there were also marked by notable development of the church's activity in many directions. Appointed in 1877 Coadjutor with right of succession to Archbishop Bailey of Baltimore, then in failing health, later in the same year he succeeded to the see, gaining with it the title "Primate of the United States." In right of this office he presided over the important deliberations of the Third Plenary Council of Baltimore in 1884, whose successful issue was largely due to him. In recognition of all these services, as well as of the growing importance of the American branch of the church, he was created Cardinal by Leo XIII in 1886, but his elevation made no difference in the simple, unostentatious kindness which had long endeared him to all who knew him, without as well as within his own communion. Bishop Curtis, formerly of Wilmington, Del., was appointed to assist him in 1896. His best-known

work is *The Faith of our Fathers* (1871), others are *Our Christian Heritage* (1889) and *The Ambassador of Christ* (1896)

GIBBONS, JAMES SLOAN (1810-92) An American author and philanthropist, born in Wilmington, Del From 1835 he was active in New York City as a banker and a writer on financial subjects A friend of Wendell Phillips, William Lloyd Garrison, and other notable Abolitionists, he rendered much aid to their cause, being a member of the executive committee of the American Anti-Slavery Society and a supporter of the *Emancipator* and *Standard* He opposed Garrison's radical disunion policy In 1863 his house in New York City was sacked on account of its illumination in honor of the Emancipation Proclamation In 1862 he published in the New York *Evening Post* his famous war song, "We are coming, Father Abraham, three hundred thousand strong" He began the movement towards the preservation of forests in the United States He wrote *The Banks of New York* (1858), *The Public Debt of the United States* (1867), and other works, some under the pen name Robert Morris His wife, Abigail, was a daughter of Isaac T Hopper

GIBBONS, ORLANDO (1583-1625) A celebrated English organist and composer In his boyhood he served as a chorister at King's College, Cambridge, in 1604 was appointed organist of the Chapel Royal and in 1623 of Westminster Abbey He is one of the most important composers in the history and evolution of English music, his services and anthems still being regularly sung in all the cathedrals and important churches of Great Britain His compositions were the earliest engraved musical works in England His madrigals, "Dauntly Sweet Bird," and "The Silver Swan," are among the best of their kind and have always been popular, while the anthems, "Hosannah to the Son of David," "Almighty and Everlasting God," and "O Clap Your Hands Together," are reckoned masterpieces of scientific writing in the fugue form, combined with exquisite melody He died of smallpox, caught while taking part in the marriage services of Charles I, for which ceremony he had composed the music His two brothers, EDWARD (c1570-c1650), organist of Bristol Cathedral, and ELLIS (?-c1650), organist of Salisbury Cathedral, were also musicians of wide repute, and his son, CHRISTOPHER GIBBONS (1615-76), succeeded in 1660 to both of his father's positions at the Chapel Royal and Westminster Abbey

GIBBS, gibz, ALFRED (1823-68). An American soldier, born in Sunswick, near Astoria, L I, a brother of Oliver Wolcott Gibbs He graduated at West Point in 1846, served as second lieutenant in the Southern campaign under Scott during the Mexican War, and was brevetted first lieutenant and captain From 1848 to 1856 he was aid-de-camp to Gen Persifor F. Smith in Mexico, Texas, New Mexico, and California, was wounded in an engagement with the Apache Indians at Cooke's Spring, N M, on March 8, 1857, and from 1858 to 1860 was employed in the recruiting service On May 13, 1861, he became captain He was captured by a Texan force in July, 1861, was paroled, and was not exchanged until August, 1862 He took an active part in various cavalry operations in Virginia, particularly under Sheridan in the Shenandoah valley, was promoted to be brigadier

general of volunteers in October, 1864, and commanded a cavalry brigade in Grant's final campaign against Lee On March 13, 1865, he was brevetted colonel and brigadier general and major general in the regular army He was mustered out of the volunteer service on Feb 1, 1866, and until his death at Fort Leavenworth, Kans, was on frontier duty at various Western posts as major of the Seventh Cavalry

GIBBS, JAMES (1682-1754) A British architect, born at Aberdeen After an apprenticeship in Holland he studied in Rome under Carlo Fontana In 1709 he returned to London, where he won the friendship of Sir Christopher Wren, by whom he was powerfully influenced His most noted works were the churches in London of St Mary-le-Strand (1714-17) and St Martin-in-the-Fields (1722)—the latter especially a prototype of many American Colonial churches, and at Oxford the famous circular Radcliffe Library (1737), but he also designed many other edifices He was the author of *A Book of Architecture* (1728), *The Rules for Drawing the Several Parts of Architecture* (1732), and *Bibliotheca Radcliffiana* (1747)

GIBBS, JOSIAH WILLARD (1790-1861) An American philologist He was born at Salem, Mass, graduated at Yale in 1809, and was a tutor there from 1811 to 1815 In 1824 he became professor of sacred literature, an appointment which he held until his death Among his publications are a translation of Storr's *Essay on the Historical Sense of the New Testament* (1817), a translation of Gesenius' *Hebrew Lexicon of the Old Testament* (1824), and *Philological Studies* (1857) He was a contributor to Prof William C Fowler's *English Language in its Elements and its Forms* (1850) and to Webster's *Unabridged Dictionary*

GIBBS, JOSIAH WILLARD (1839-1903) An American physicist, born at New Haven, Conn He graduated at Yale in 1859 (Ph D 1863), was a tutor there for three years, and afterward studied in Paris, Berlin, and Heidelberg In 1871 he was appointed professor of mathematical physics at Yale He was elected a member of the National Academy of Sciences and of the Royal Society of London, was a vice president (1886) of the American Association for the Advancement of Science, and was awarded the Rumford medal of the American Academy of Arts and Sciences for researches in graphical and analytical methods in thermodynamics His writings include numerous papers on mathematical physics, and *Elementary Principles in Statistical Mechanics* (1902)

GIBBS, (OLIVER) WOLCOTT (1822-1908). A distinguished American chemist He was born in New York City, graduated at Columbia College in 1841 and at the College of Physicians and Surgeons in 1847, and subsequently studied medicine and the physical sciences in Germany From 1863 to 1887 he was Rumford professor at Harvard and lectured on science as applied to the useful arts During the Civil War he was an active member of the Sanitary Commission and in 1873 went as one of the commissioners to the Vienna Exposition He is the author of many papers on chemical science in the *American Journal of Science* He was president of the National Academy of Sciences in 1897 Dr Gibbs carried out many original investigations in physics and chemistry His researches on vapor densities, on the platinum metals, and on the ammonia-cobalt bases were

important The Wolcott Gibbs laboratory of physicochemical research at Harvard University is named after him

GIBBSITE An aluminum hydrate, crystallizing in the monoclinic system, but usually found in mammillary crusts and stalactitic shapes It is commonly white, grayish, or yellowish Gibbsite is found in small deposits, often associated with limonite, also with the bauxite of Georgia and Alabama Gibbsite is an unimportant ore of aluminum

GIBEAH, gib'e-a (Heb. *Gib'ah*, hill) The name of several places in ancient Palestine, the chief of which was Gibeah of Benjamin, or Gibeah of Saul It was north of Jerusalem and south of Ramah and was the scene of the story of the Levite and his concubine (Judg. xix-xxi) It was the home of Saul and probably his birthplace (1 Sam. x. 26) Two sons and five grandsons of Saul are said to have been executed here in revenge for a slaughter of the Gibeonites by Saul Gibeah of Benjamin has been identified with the modern village of Tell el-Ful, about 4 miles north of Jerusalem

GIBEL, gib'el (Ger., sort of chub, Fr. *gibel*; possibly connected with Ger. *Giebel*, gable, OHG *gebal*, head, *gibulla*, skull, Gk. *κεφαλή*, *kephalē*, head), or PRUSSIAN CARP. A small carp (*Cyprinus gibelio*) without barbels, common in some parts of continental Europe and in England It differs from the crucian in having a forked tail and is an excellent table fish See CARP

GIBEON, gib'e-on (Heb. *Gib'on*, hilly). An ancient city of Palestine, northwest of Jerusalem, at the time of the conquest by the Israelites inhabited by the Hivites (Josh. ix. 3, 7). By means of a stratagem the Gibeonites secured a promise of friendship from Joshua The deceit was afterward discovered, but the letter of the promise was kept, the Gibeonites being condemned to be "hewers of wood and drawers of water for the congregation," and when the five kings of the Amorites attacked Gibeon, Joshua went to its assistance (Josh. ix. 3-x. 7) It was during the battle fought on this occasion that "the sun stood still and the moon stayed, until the people had avenged themselves upon their enemies," according to the testimony of a song preserved in the collection called *Sefer ha yashar*, or 'Book of the Brave,' quoted and approved by the historian in Josh. x. 8-14. Saul almost exterminated the Gibeonites (2 Sam. xxi. 1-5) Gibeon was the scene of a battle between David's forces and those of Ishbaal (2 Sam. ii. 12-32), and at "the great stone which is in Gibeon" David's general, Joab, treacherously slew the other general, Amasa (2 Sam. xx. 4-10). The city had its chief importance as the seat of a *bamah* (high place), called in 1 Kings iii. 4 "the great high place" At the beginning of his reign Solomon sacrificed there 1000 burnt offerings, and Yahwe appeared to him in a dream by night (1 Kings iii. 4-15) Gibeon is identified with the modern village of el-Jib, about 5 miles northwest of Jerusalem

GIBRALTAR, jib-ra'l'tēr, *Sp. pron* He-bral-tar'. A town and fortress, constituting a British colony, on the rocky promontory of Gibraltar, forming the eastern horn of the Bay of Algeiras, or Gibraltar, on the south coast of Andalusia, Spain, at the eastern end of the Strait of Gibraltar, at the entrance to the Mediterranean (Map Spain, C 5). It was captured by the

British forces under Sir George Rooke, July 24, 1704, and was ceded to Great Britain by the Treaty of Utrecht in 1713 It stands opposite the Spanish town of Algeiras, 6 miles distant on the west side of the bay, with which it has steam-ferry communication several times daily Owing to its important strategical position, it is called the "Key of the Mediterranean" The sandy isthmus connecting the promontory with the mainland is neutral territory, it lies so low that from the sea Gibraltar has the appearance of an islet The Spanish town of La Línea de la Concepción, practically a suburb of Gibraltar, on the mainland, fronts the isthmus and the neutral ground, the Spanish boundary being marked by a double line of sentry boxes The population of La Línea (commune) in 1910 was 30,005 The promontory, or "Rock of Gibraltar," is composed of gray primary marble Its length is $2\frac{3}{4}$ miles, its greatest breadth about $\frac{3}{4}$ of a mile, and its greatest elevation 1439 feet The area of Gibraltar is $1\frac{1}{8}$ square miles Although it has a barren and uninviting aspect, aloes, cacti, palmitas, capers, and asparagus grow in the crevices, and there are grassy wooded glens in certain parts, where partridges, pigeons, woodcocks, and fawn-colored Barbary apes are to be found There are several natural caves in the rock, of which St Michael's, with an entrance 1100 feet above the sea, is the largest The north, east, and south sides of the promontory are so steep and precipitous as to be almost inaccessible, the north and northwest sides are honeycombed by fortified artificial galleries The town and harbor on the west are protected by batteries and forts rising from the base to the summit of the rock Modern guns of the most formidable pattern have replaced the old armaments The harbor is formed by three separate moles, known as the North, the South, and the Detached moles The North Mole runs westward about 2900 feet and then southward, having a total length of over a mile The South Mole extends from the shore northwesterly 3660 feet The Detached Mole, 2717 feet long, is situated between the other moles, forming a breakwater and leaving at either end a passage for vessels The water area of the harbor is 440 acres There are three large graving docks for naval purposes and a small dock available to merchant vessels of light draft

The town, divided by the Alameda park into two parts, although irregularly laid out, contains several fine public buildings The houses are built in terraces and for the most part are of Spanish architecture There are an Anglican cathedral, four Roman Catholic churches, and hospitals The water supply depends on the rainfall, which is stored in a system of huge tanks The climate is the warmest in Europe, but is healthful, the former unsanitary conditions having been removed by modern methods The colony is self-supporting, the revenue in 1912 being £105,738 and the expenditure £81,613, but the garrison is maintained by the British government Gibraltar is a free port except as to alcoholic liquors and tobacco It is also an important coaling station The tonnage of vessels entered and cleared was over 11,700,000 in 1911, of which over 7,100,000 British The legal currency is British, but Spanish money is also in circulation There is no legislative body or executive council The Governor, who is also the general commanding the garrison, exercises

ROCK OF GIBRALTAR

both executive and legislative functions. The civil population, according to the census of 1891, was 19,100, 1901, 20,355, 1911, 19,586 (9228 male, 10,358 female). In 1911 the military population was 5340, naval, 441, total population, 25,367. Estimate for 1913, 23,572. The inhabitants are largely of Spanish and Italian descent, but include Britons, Jews, and Moors. Among the civil population the birth rate is about 20 and the death rate about 15.

Gibraltar (the Phœnician Alube and Greek Calpe) and Abyla (the Sierra Bullones near Ceuta, Morocco) are the classical "Pillars of Hercules," which were crowned by silver columns erected by the Phœnician mariners to mark the limits of navigation. After 711 the rock was named Jebel-al-Tarik (Hill of Tarik, whence its modern name), after the Arab chief Tarik ibn Ziad, who built a fortress on the promontory, part of which still exists. In 1309 Gibraltar was taken by the Castilians, but was regained by the Moors in 1333 and held until 1462, when it finally passed from their possession. In 1502 it was annexed to the Spanish crown. After the sacking of Gibraltar by Barbarossa, the Algerine, in 1540, extensive works were built by command of Charles V. In 1704 it was captured by a combined Dutch and English force under Sir George Rooke and the Prince of Hesse-Darmstadt, fighting for the Archduke Charles of Austria, but it was unscrupulously taken possession of for the crown of England by the British admiral. The Treaty of Utrecht (1713) ceded the fortress to Great Britain. The most important event in its subsequent history is the famous siege of three years, seven months, and twelve days, extending from 1779 to 1783, which bristled with exciting incidents. Communications with Spain were closed on June 21, 1779, and a strict blockade was established by the Spanish fleet, the strength of the besieged force at this period was 5382 men, under General Eliott, the Governor. Twice the garrison was almost reduced to starvation, being temporarily relieved in the face of great opposition—on the first occasion by Admiral Rodney, who added 1000 to the defenders, and on the second occasion by Admiral Darby. In July, 1782, the Duc de Crillon took command of the combined naval and land forces of France and Spain employed in the siege and made preparations for a supreme effort. Additional batteries were constructed on the land side, and 10 enormous and presumed invincible floating batteries were constructed by the Chevalier d'Arçon. Covered boats to disembark 40,000 troops were also prepared. The formidable attack commenced on September 8, and continued until the 13th, when, by the expedient of red-hot balls, the British destroyed the floating batteries and repulsed their enemies, of whom over 2000 were killed. The British casualties were 16 killed and 68 wounded. The signing of the preliminaries of peace put an end to the siege in February, 1783. In 1830 a Charter of Justice was given to the people and the inhabitants were granted civil liberty. Consult Drinkwater, *History of the Siege of Gibraltar* (London, 1785, new ed., 1844), Mann, *History of Gibraltar* (ib., 1870), Field, *Gibraltar* (New York, 1889), Boyle, *Gibraltar* (British Empire, Ser. v, London, 1902); Spilsbury, *Journal of the Siege of Gibraltar* (ib., 1908), Lang, *Gibraltar and the West Indies* (New York, 1909).

GIBRALTAR, STRAIT OF (Lat. *Fretum Her-*

culeum) A narrow passage connecting the Atlantic Ocean with the Mediterranean Sea and separating Spain from Morocco (Map Europe, C 5). Its length is about 40 miles, and its width varies from about 9 miles at the west entrance to about 13 miles at the east entrance. A channel, 5 miles wide, through the centre of the Strait has a depth of 1000 feet. A continual central current enters from the Atlantic, and tidal currents ebb and flow along the European and African shores. It has been demonstrated that there exists a west-flowing undercurrent which carries off the surplus waters of the Mediterranean.

GIBRALTAR OF AMERICA A frequent name for Quebec, because of its position and strong fortifications.

GIBSON, gib'son, CHARLES DANA (1867–) An American illustrator. He was born at Roxbury, Mass., Sept. 14, 1867. The first eight years of his life were spent in Boston. Later his home was in Flushing, L. I. He studied at the Art Students' League, New York, and under Saint-Gaudens. In 1886 he made his debut as an artist for the periodicals. In 1889 he went to Paris and was enrolled at Julian's studio. Returning to New York, he was active as an illustrator for *Life*, the *Century*, *Scribner's*, *Harper's*, and other magazines. The publication of his drawings in album form greatly increased his popularity. In 1893–94 he was again in Paris, in 1895–96 in London, in 1898 in Munich. Gibson is one of the greatest living masters of black and white. His method is original and has been frequently imitated, but never equaled. It combines daintiness with boldness and is characterized by free insistence on live and brilliant high lights. He has a strong feeling for the beautiful, the dramatic, and the humorous. His types, while not numerous, are well characterized. He excels in depicting well-bred American society, and is the creator of the fascinating, haughty, egotistic "American Girl," so popular in modern illustrations. His subjects are taken from the boulevards, byways, theatres, clubs, law courts, music halls, parks, and crowds in stations. His published works include *London, as Seen by C. D. Gibson* (1895–96), *Pictures of People* (1896), *People of Dickens* (1897), *Sketches and Cartoons* (1898), *Sketches in Egypt* (1899), *The Education of Mr. Pip* (1899), *Americans* (1900), *A Widow and her Friends* (1901), *The Social Ladder* (1902), *Our Neighbors* (1905). Among the books illustrated by him are Anthony Hope's *Prisoners of Zenda* and *Rupert of Henzau*, R. H. Davis's *Soldiers of Fortune*, and Robert Grant's *Art of Living*. From 1900 to 1905 he devoted himself almost wholly to cartoons for *Life* and *Collier's Weekly*. In the latter year he gave up illustrating and went to Europe to study color painting, in which he achieved real success, but he has since returned to New York and resumed illustration.

GIBSON, EDMUND (1669–1748) Bishop of London and an authority upon canon law. He was born at Bampton, entered Queen's College, Oxford, in 1686, and in 1692 published an edition of the *Saxon Chronicle*, with a Latin translation, indexes, and notes. This was followed in 1693 by an annotated edition of the *De Institutione Oratoria* of Quintilian and in 1695 by a translation of Camden's *Britannia*, "with additions and improvements," in the preparation of which he had the assistance of several other

scholars The year preceding he had taken holy orders and became chaplain and librarian to Thomas Tenison, Archbishop of Canterbury In 1703 he became rector of Lambeth and in 1710 Archdeacon of Surrey In the discussions which arose in the reigns of William and Anne relative to the rights and privileges of the Convocation, Gibson took a very active part and in a series of pamphlets warmly advocated the right of the Archbishop to continue or prorogue that assembly The controversy suggested to him the idea of those researches which resulted in the *Code Juris Ecclesiæ Anglicanæ* In 1716 Gibson was consecrated Bishop of Lincoln, whence he was, in 1723, translated to London, where for 25 years he exercised an immense influence, being the authority chiefly consulted by the court on all ecclesiastical affairs Among the literary efforts of his later years the principal were a series of *Pastoral Letters* and the *Preservative against Popery* (1738), a compilation of numerous controversial writings of eminent Church of England divines, dating chiefly from the period of James II He died at Bath, Sept 6, 1748

GIBSON, JOHN (1790-1866) An English sculptor He was born at Gyffin, near Conway, North Wales, and at an early age was apprenticed to a cabinetmaker in Liverpool When 16 years old he was employed in the marble works of Francis, at Liverpool, where his talents gained him the patronage of William Roscoe, who not only became his friend, but also secured him pecuniary aid In 1817 he made his way to London, and in the same year he went to Rome, bearing a letter of introduction from Lord Brougham to Canova He entered the atelier of Canova, also studying under Thorvaldsen, and remained in Rome 27 years, executing in that city most of his important works

In 1819 he executed his first commission, a group of "Mars and Cupid," for the Duke of Devonshire, now at Chatsworth Under the influence of Canova and Thorvaldsen his work became thoroughly classic, and he excelled in portraying ideal Greek subjects of youthful beauty Among the most famous of these are the "Sleeping Shepherd Boy," his first work at Rome, and "Hylos Surprised by Nymphs" (1826), the latter in the National Gallery, London, and especially his statue of "Venus with the Turtle," one of his latest works, which he himself considered his best In this statue and in others he made use of the polychromy of the Greeks, as he conceived it He was so thoroughly wedded to Greek art that when commissioned to make a portrait statue of Queen Victoria he would do it in no other wise than represent her in classical draperies and with sandals In the palace of Westminster he carved the group in which the Queen is represented leading the allegorical figures of "Clemency" and "Justice" The only religious subject he portrayed was "Christ Blessing the Little Children" His best work in the round was the "Hunter and Dog" His classical tendencies interfered with his success in portrait statues Among the best known of these are the colossal statue of Huskisson (1844), in Liverpool, and two other statues of the same statesman, Sir Robert Peel, in Westminster Abbey, and George Stephenson, in Liverpool Gibson was a man of kindly life and character and notoriously absent-minded His only pupil and most intimate friend was Harriet Hosmer, the American sculp-

tress He died in Rome, Jan 27, 1866 Consult his *Life* by Lady Eastlake (London, 1870), which also contains his autobiography, and Carr, *Essays on Art* (1b, 1879)

GIBSON, JOHN MONRO (1838-1921) A British Presbyterian clergyman, born at Whitehorn, Scotland He went to Canada in 1855, graduated in 1862 at Toronto University, and in 1864 at Knox College (theological), Toronto, and in 1864-74 was pastor of the Erskine Church, Montreal, and in 1868-74 lecturer in Hebrew and Greek exegesis at Montreal Theological College He was pastor of the Second Presbyterian Church, Chicago, in 1874-80, and then of the St John's Wood Presbyterian Church, London, England In 1891 he was elected moderator of the Presbyterian church in England, and in 1897 president of the national council of Free churches He wrote *The Ages before Moses* (1879), *The Foundations* (1880), *The Gospel of Matthew* (1890) in the "Expositor's Bible", *The Unity and Symmetry of the Bible* (1896), *From Fact to Faith* (1898), *The Glory of Life* (1900), *Apocalyptic Sketches* (1901), *Protestant Principles* (1901), *Devotional Study of Holy Scripture* (1904), *The Inspiration and Authority of Holy Scripture* (1908)

GIBSON, SIR JOHN MORISON (1842-) A Canadian administrator He was born near Toronto and was educated at Toronto University, where he graduated with the highest honors in 1863 and afterward took a law course He practiced his profession in Hamilton, where he became one of the leaders of the provincial bar Entering politics in 1879, he was a Liberal member of the Ontario Legislature almost continuously from that year until 1905 In 1889-96 he was Provincial Secretary in the administration of Sir Oliver Mowat (qv), in 1896-99, Commissioner of Crownlands in the administration of Sir Arthur Sturgis Hardy (qv), and in 1899-1905, Attorney-General in the administration of Hon George William Ross (qv) He early manifested an active interest in military matters, served in the militia during the Fenian raid of 1866, rose to the rank of lieutenant colonel in 1895, and was brigade commander in 1905-09 While he was a member of the Legislature he procured the passage of laws restricting the liquor traffic, reorganizing the Ontario insurance system, conserving fish and game resources, and for the protection of neglected and dependent children In 1908-14 he was Lieutenant Governor of Ontario In 1912 he was knighted

GIBSON, MARGARET DUNLOP (née SMITH) (?-1920) A British Orientalist, born in Ayrshire With her sister, Mrs Agnes Smith Lewis, she visited Palestine several times (especially after 1886, when her husband, James Young Gibson, translator of Cervantes, died) In 1892 they discovered and photographed the Syriac palimpsest of the Gospels in the Sinai The two sisters gave the site in Cambridge for Westminster Theological College (Presbyterian), opened in 1899 Mrs Gibson received honorary degrees from Heidelberg, St Andrew's, and Dublin universities She wrote *How the Codex was Found* (1893), *Apocrypha Sinaitica* (1896), *Horæ Semitice* (1903 et seq), *The Commentaries of Isho'dad* (1911), Syriac and English *Commentaries on Acts* (1913)

GIBSON, RANDELL LEE (1830-92) An American soldier and legislator He was born at

Spring Hill, Ky, and graduated at Yale (valedictorian) in 1853 and at the law school of the University of Louisiana (now Tulane University) in 1855. Admitted to the bar, he went to Europe and studied at Berlin and at Madrid, where he was attached to the American Legation. In 1856 he returned to Louisiana, where he was engaged in sugar planting until the outbreak of the Civil War. Enlisting as a private in the Louisiana volunteers, he was rapidly promoted, was appointed colonel of the Thirteenth Louisiana Infantry, and commanded a brigade at Shiloh, where he led four unsuccessful charges on the famous "Hornets' Nest." He fought in the battles of Perryville, Murfreesboro, and Chickamauga, and was promoted brigadier and major general. He participated in the battles during Johnston's retreat from Dalton to Atlanta, at the battles of Jonesboro and Nashville, and in the Mobile campaign, where he successfully defended Spanish Fort against General Canby. After the war he began the practice of law in New Orleans. He was elected to Congress in 1872, but was not seated. On his second election, in 1874, however, he was seated and remained in the House of Representatives until 1883, after which, until his death, he was a member of the United States Senate, where, as in the Lower House, he worked for the improvement of the Mississippi River and the establishment of the Mississippi River Commission. He was president of the board that administered the fund for Tulane University and a trustee of the Peabody Fund. A selection from his speeches in the Senate was published in Washington in 1891.

GIBSON, THOMAS MILNER- (1806-84). An English statesman. The only son of Major Milner Gibson, he was born at Port of Spain, Trinidad, West Indies, Sept. 3, 1806. He was first educated at Dr Cogan's Unitarian School, Walthamstow, where Benjamin Disraeli was his classmate. He entered at the Charterhouse School in 1819 and in 1830 received the B.A. degree at Trinity College, Cambridge. In 1837 he entered Parliament as Conservative member for Ipswich, but became a Liberal and resigned two years later. He assumed the surname of Milner-Gibson by royal license in 1839. After unsuccessful attempts to reenter Parliament, he was returned for Manchester in 1841. In 1846 Lord John Russell made him Privy Councillor and Vice President of the Board of Trade. As president of the Association for the Repeal of Taxes on Knowledge, his crusade against the excise on paper, the advertisement duty, and the newspaper stamp duty, resulted in the repeal of these taxes in 1861, and Milner-Gibson was the recipient of a public testimonial. At the outbreak of the Crimean War he identified himself with the "Peace Party" of Cobden and Bright. His views were distasteful to his constituency, and he was unseated in 1857, but the same year was returned for Ashton-under-Lyne, which he represented till 1868, when his defeat at the general election led to his retirement from political life with a pension of £2000. From 1859 to 1866 he was president of the Poor-Law Board, and President of the Board of Trade with cabinet rank. He was an enthusiastic yachtsman, senior member of the Royal Yacht Squadron, and also an elder brother of Trinity House. He died on board his yacht at Algiers, Feb. 25, 1884.

GIBSON, WILLIAM (1788-1868). An American surgeon, born in Baltimore, Md. He gradu-

ated at Princeton in 1806 and at the University of Edinburgh in 1809. In 1815 he fought with the Allies at Waterloo. From 1819 to 1855 he was professor of surgery in the University of Pennsylvania. He was the friend of Lord Byron and of many noteworthy English and European surgeons. He published *Principles and Practice of Surgery* (2 vols., 1824), once widely used and *Rambles in Europe* (1839). Consult Gross, *Lives of Eminent American Physicians and Surgeons of the Nineteenth Century* (Philadelphia, 1861).

GIBSON, WILLIAM (1849-1914). A Canadian capitalist and legislator. He was born at Peterhead, Scotland, and was educated at the Peterhead Academy. Coming to Canada in 1870, he engaged in business and became a successful railway contractor, wealthy, and a director in various industrial and financial corporations. He handled some of the most important railway contracts in Canada, including the masonry on both sides of the St. Clair River Tunnel, the Sarnia portals and their approaches, and the enlargement of the Victoria Jubilee Bridge, Montreal. In 1891-1900 he was a Liberal member of the House of Commons and in 1900 was appointed chief Liberal "whip" for that body. In 1902 he became a member of the Dominion Senate.

GIBSON, WILLIAM HAMILTON (1850-96). An American illustrator and author, born at Sandy Hook, N. J. He studied at Washington, Conn., and afterward at the Polytechnic Institute, Brooklyn. His career as an artist began with illustrations of botanical drawings for the *American Agriculturist* and *Hearth and Home*, also for *Harper's Magazine* and the *Art Journal*. Gibson's drawing are very correct and minute in detail, and in water color he used a few tints exquisitely. His subjects include the interpretations of woodland beauties and of flowers and insects. His art is pervaded with the accuracy of the lover of scientific fact, and he was a successful lecturer on botany. He was author and illustrator of the following publications: *Camp Life in the Woods* (1882), *Highways and Byways* (1883), *Happy Hunting Grounds* (1886), *Sharp Eyes* (1892), *Our Edible Toadstools and Mushrooms* (1895), *Eye Spy* (1897). He made the illustrations for E. P. Roe's *Nature's Serial Story* and was one of the illustrators of *Picturesque America*. A memorial exhibit of his works was held at the National Arts Club, New York, in 1900. Consult Adams, *W. H. Gibson* (New York, 1901).

GICHEL, gik'tel, JOHANN GEORG (1638-1710). A German mystic. He was born in Regensburg and was a lawyer by profession. In 1664 he came under mystic influence, experienced visions, and thenceforth devoted himself entirely to a Society for Christian Edification. His teachings brought him frequently into conflict with the authorities. Banished from his native town, he betook himself to Holland, where the same experience was repeated. After 1668 he lived at Amsterdam. He founded an order whose members called themselves "Angelic Brethren" because they renounced marriage. He made the first collected edition of the writings of Jakob Boehme (Amsterdam, 1682). His own writings appeared in a collected edition at Leyden in 1722, and his biography, in connection with Boehme's, was written by Harless (Leipzig, 1882).

GID, gid (from *giddy*), or **STURDY**. A disease

of sheep, caused by the presence of the larva of a tapeworm, *Multiceps multiceps* (*Taenia cœnurus*) in the brain. Before the life history of this parasite was discovered the larva was known as *Cœnurus cerebralis*, which sometimes attains the size of a hazelnut. It floats in a watery fluid inclosed in a membranous sac. Should the larva be eaten by a dog, it develops in the dog's intestines to a vermiform parasite, and produces eggs which, being voided by the dog in the detached segments, may be picked up by the sheep while grazing. The hard shell of the egg is digested off, and a minute embryo liberated, which bores its way through the walls of the digestive tract, and finally into a blood vessel and reaches the brain by way of the blood stream. Coyotes may also serve the same office as the dog in the life cycle of the worm. The afflicted sheep staggers when moved, turns stupidly around almost in one spot, usually towards the side upon which the parasite lies, and loses flesh because these conditions interfere with food prehension. The parasite and its sac may generally be safely removed by placing the sheep, with its feet tied, on a table or bench, searching for the softened portion of the skull, which generally overlies the hydatid, laying back a flap of skin, and introducing the trochar and cannula, and, when the sac is deep-seated, cautiously withdrawing it with the help of a small syringe. Protected by a leather cap and simple water dressings, the wound speedily heals. In preventing the spread of this disease, which is especially common in low, damp pastures, and among sheep from 6 to 20 months old, it is desirable to burn the heads of affected sheep, otherwise they may be eaten by dogs in which the immature tapeworms would develop to the adult egg-laying form. Consult M. C. Hall, "The Gid Parasite and Allied Species of the Cestode Genus *Multiceps*," *United States Department of Agriculture, Bureau of Animal Industry, Bulletin 125* (1910), id., "Some Important Facts in the Life History of the Gid Parasite and their Bearing on the Prevention of the Disease," *United States Department of Agriculture, Bureau of Animal Industry, Circular 159* (1910), id., "Methods for the Eradication of Gid," *United States Department of Agriculture, Bureau of Animal Industry, Circular 165* (1910).

GID'DINESS See VERTIGO

GIDDINGS, gid'dingz, FRANKLIN HENRY (1855-) An American sociologist and economist, born at Sherman, Conn. He graduated at Union College (1877) and engaged in newspaper work, writing on politics and economics for the *Springfield Republican* and the *Springfield Daily Union*. In 1888 he was appointed lecturer in political science at Bryn Mawr, where he was subsequently advanced to the chair of political science, and in 1894 he became professor of sociology at Columbia University. From 1892 to 1905 he was a vice president of the American Academy of Political and Social Science. His principal works are *The Modern Distributive Process* (in collaboration with J. B. Clark, 1888), *The Theory of Sociology* (1894), *Principles of Sociology* (1896), *The Theory of Socialization* (1897), *Elements of Sociology* (1898), *Democracy and Empire* (1900), *Inductive Sociology* (1901), *Descriptive and Historical Sociology* (1906). The working principle by which he seeks to explain the fundamental sociological phenomena

is psychical in its nature—"consciousness of kind" in his earlier works, "like response to like stimuli" in the *Inductive Sociology*. In this he differs radically from the school of contemporary writers, who seek to explain sociological facts in terms of the environment. His later works are characterized by the ingenious application of statistical method to sociological material. See SOCIOLOGY.

GIDDINGS, JOSHUA REED (1795-1864) An eminent American legislator, prominent as a "Constitutional" Abolitionist in the antislavery struggle. He was born at Tioga Point (now Athens), Pa., Oct. 6, 1795. His early life was spent in Canandaigua, N. Y., until his parents removed to Ashtabula County, Ohio, where he afterward resided. He enlisted as a soldier in the War of 1812 and served for a few months in the protection of the Western Reserve against the Indians, then taught school, studied law, and in 1821 began professional practice at Jefferson. In 1826 he was sent to the State Legislature and in 1838 to Congress. The slavery agitation had already begun, and Giddings became a forceful advocate of the abolition of slavery in the District of Columbia and the national Territories. He supported the efforts of John Quincy Adams to maintain the right of petition and in fact seized upon every opportunity to develop a public sentiment hostile to slavery. On Feb. 9, 1841, he delivered a powerful speech upon the Indian War in Florida, insisting that it was waged in the interest of slavery. While the excitement caused by the *Creole case* (qv) was at its height, he introduced in the House of Representatives a series of resolutions declaring that the slaves, having simply asserted their indefeasible right to liberty, were guilty of no crime, and that as soon as they left the jurisdiction of Virginia they became free. The resolutions created a tumultuous excitement, and Giddings was censured by vote of the House for presenting them. He thereupon resigned his seat, but was reelected by a very large majority. He was kept at his post by successive reelections until 1859, thus completing a continuous service of 20 years. Until 1848 he was a member of the Whig party, supporting its principal measures, but maintaining his independence in all matters relating to slavery. He did much to develop those views with regard to the relation of slavery to the national government which afterward became the basis of the Republican party. He took a prominent part in the struggle to prevent the extension of slavery to the territory wrested from Mexico by the War of 1846-47, and in resisting the adoption of the Compromise of 1850, especially the reenactment of the Fugitive Slave Law (qv). He was also conspicuous in the debates which preceded the repeal of the Missouri Compromise in 1854 and in the great struggle by which Kansas was made a free State. On May 8, 1856, while addressing the House, he suddenly fell to the floor in a state of unconsciousness. He soon revived, but his former strength was never fully restored. On Jan. 17, 1858, he fell again in the same way and for a time was supposed to be dead. He again rallied, however, but was compelled for a time to leave his post. In 1861 he was appointed Consul General for the British North American Provinces, with headquarters in Montreal. In 1843 he wrote a series of political essays signed "Pacifcus," which attracted wide attention. A volume of his speeches was pub-

lished in 1853. He also wrote *The Exiles of Florida* (1858) and *The History of the Rebellion Its Authors and Causes* (1864). Consult Buel, *Joshua R. Giddings* (Cleveland, 1882), and, more particularly, Julian, *Life of Joshua R. Giddings* (Chicago, 1892).

GIDE, zhéd, CHARLES (1847–) A French political economist, born at Uzès (Gard). From 1874 to 1880 he was professor of jurisprudence at Bordeaux, in the latter year became professor of political economy at Montpellier, and in 1898 professor at the University of Paris and the Ecole des Ponts et Chaussées. He was a leader in the movement towards "Christian Socialism" organized by French Protestants, and in his writings expressed the views of the classical French school of economics. He became Chevalier of the Legion of Honor. His publications include *Du droit d'association en matière religieuse* (1874), *Principes d'économie politique* (1884, 13th ed., 1911), *Etude sur l'Act Torrens* (1886), *La Coopération* (1900, 3d ed., 1910), *Les sociétés coopératives de consommation* (1904, 2d ed., 1909), *La séparation des églises de l'état* (1905), *Economie sociale les institutions du progrès social au début XX siècle* (1905, 4th ed., 1912), *Cours d'économie politique* (1909, 2d ed., 1911), and, with Charles Rist, *Histoire des doctrines économiques* (1909).

GIDEL, zhéd'él, CHARLES ANTOINE (1827–1900) A French author, born at Gannat (Allier). He was a professor successively at the Lycée Henri IV, the Lycée Louis le Grand, and the Lycée Condorcet. His most important work is the *Histoire de la littérature française* (1874–91). His *Etude sur Saint-Evremond* (1866) received the Prix d'Eloquence from the Academy.

GIDEON, gid'é-on (Heb. *Gid'on*, perhaps connected with *gādā'*, to fell). A Hebrew warrior, also called Jerubbaal and once (2 Sam xi 21) Jerubbesheth. According to the biblical narrative, Gideon delivered the Hebrews from the oppression of the Midianites and became one of the "judges" of Israel, and his son Abimelech was made "king" in Shechem (Judg vi–ix). Gideon and Jerubbaal are supposed by many scholars to be two distinct personages. On this assumption Gideon belongs to the western section of Manasseh, Jerubbaal to the eastern, or perhaps to the tribe of Gad. The stories regarding these heroes, after being confused in the minds of the people, are thought to have been combined by successive narrators into a single tale. In the case of both heroes the opponents against whom they contend successfully are Midianites. According to the original Gideon narrative, these Midianites choose the harvest time as the most favorable moment of attack, when they are certain of reaping a rich booty. Gideon at Ophrah receives the summons through Yahwe to gather his clansmen in order to resist the expected attack of the nomads. Warriors of Ephraim join with those of Manasseh, and the march is begun to Mount Gilboa, beneath which the Midianites are encamped. Gideon approaches the camp stealthily and, encouraged by hearing one of the Midianites relating to his fellow a significant dream, returns to the Hebrew camp. With the war cry "the sword of Yahwe and of Gideon" the Hebrews rush upon the Midianites, who are utterly routed and flee to the distant slope of Abel Meholah. They are followed by the victorious Hebrews, who succeed in capturing two of the princes of

the Midianites, Oreb and Zeeb, and their heads are brought to Gideon. In the original Jerubbaal story the hero, residing at Jazer, is represented as proceeding with 10 members of his household at night against the Midianites and inflicting a slaughter upon them. In revenge the Midianites turn against Jerubbaal's brethren, slay them, and go on plundering and killing far to the north. Jerubbaal now gathers 300 warriors of his clan around him and, after enduring many hardships on the road, finally encounters the Midianites at Karkor. By means of a stratagem he surprises and throws the Midianites into a panic, the result of which is a complete defeat of the marauders. Jerubbaal captures the two kings of Midian, Zebah and Zalmunna, and puts them to death. In the legendary amplification of this narrative Jerubbaal is recognized as King by his people, and since, as a worshiper of Yahwe, it seemed distasteful to later editors that he should have a name which contained Baal as an element, the name is interpreted and modified as though it indicated "opposition to Baal" (Judg vi 32), and in one instance (2 Sam xi 21) is disguised by substituting *besheth* for it. (See BAAL.) In general, however, the name "Gideon" is quietly substituted for "Jerubbaal." The similarity of the two stories no doubt was one element which led to their confusion in the minds of the people, but the combination is essentially the work of narrators who aimed at reconstructing the past from the point of view of zealous devotees of Yahwe. In the course of the narratives stress is laid on the fact that the oppression of the Midianites is a punishment sent because the people had fallen away from Yahwe, while Gideon is represented as a devoted worshiper of Yahwe, who at the risk of his life destroys the Baal altars in his town (Judg vi 25–32). Consult the chapters on Gideon-Jerubbaal in the Hebrew histories of Stade, Kittel, Guthe, Wellhausen, and the commentaries on the Book of Judges by Studer, Bachmann, Moore, and Budde, also Niebuhr, *Studien zur Geschichte des alten Orients*, vol. 1 (Berlin, 1894), Budde, *Richter und Samuel* (Giessen, 1890), Kittel, *Studien zur hebraischen Archäologie* (Leipzig, 1908).

GIEHRL, gér, EMMY (1837–) A German writer of juveniles, born in Regensburg, daughter of the Bavarian Minister of Finance Von Aschenbrenner. In 1858 she married Rudolf Giehl, and after his death, in 1876, began writing for children, often under the pseudonym of "Tante Emmy." She brought out for more than 30 years a *Kinderkalender*. In 1894–99 a collected edition of her stories for children appeared in 15 volumes. She also published *Erinnerungen aus meiner Jugend* (1899) and *Meine Lieder, was ich in fünfzig Jahren singe* (1913).

GIERS, gérz, NIKOLAI KARLOVITCH DE (1820–95) A Russian statesman. He served for some years in the Asiatic Department of the Ministry of Foreign Affairs and was sent as Minister Plenipotentiary to Teheran in 1863, to Bern in 1869, and to Stockholm in 1872. After his marriage into the family of Prince Gortchakov the latter made him his adjunct. In 1882 Giers succeeded the Prince as Minister of Foreign Affairs, having meanwhile shown himself an astute diplomat in the negotiations with Great Britain on the Afghan boundary question, and in this position he distinguished himself by his wise con-

servatism and the maintenance of peaceful relations with other European powers.

GIES, gēz, WILLIAM JOHN (1872-) An American biological chemist, born at Reisters-town, Baltimore Co, Md. He graduated from Gettysburg College in 1893 and studied also at Yale (PhD, 1897), Bern, and Woods Hole, Mass. A member of the faculty of Columbia University after 1898, he became in 1907 professor of biological chemistry, he was appointed professor of physiological chemistry in the New York College of Pharmacy in 1904 and in Teachers College (Columbia) in 1909, and prominently identified himself with the New York Botanical Gardens. Besides much editorial work, especially for various scientific societies, his writings include *Biochemical Researches* (4 vols, 1903-09), *Text-Book of General Chemistry* (1904), *Text-Book of Organic Chemistry* (1905, 1909); *Laboratory Work in Biological Chemistry* (1906).

GIESEBRECHT, gē'ze-brēkt, FRIEDRICH WILHELM BENJAMIN VON (1814-89). A celebrated German historian, born in Berlin. He pursued historical studies at the University of Berlin as a pupil of Leopold von Ranke. In 1857 he was appointed professor of history at Königsberg and in 1862 accepted a call to Munich. His *Geschichte der deutschen Kaiserzeit* (vol 1, 1855-vol vi, 1895), a monumental undertaking for which the Berlin Academy awarded him the prize established by Friedrich Wilhelm IV in recognition of distinguished service to German history, is marked in the earlier volumes by much attractiveness of presentation and throughout by a minute and exacting investigation of sources. Consult a memorial oration by Riezler (Munich, 1891).

GIESELER, gē'ze-lēr, JOHANN KARL LUDWIG (1792-1854). One of the greatest of Church historians. He was born March 3, 1792, at Petershagen, near Minden, Westphalia, where his father was a clergyman. He was educated at Halle and in October, 1813, entered the army as a volunteer during the War of Liberation. In 1818 he was appointed to the directorship of a newly instituted gymnasium at Cleves and published his *Historisch-kritischer Versuch über die Entstehung und die frühesten Schicksale der schriftlichen Evangelien*. In consequence of this publication he was called, in 1819, as professor of theology, to the University of Bonn, which had been established but shortly before. It was in this place that he began his great work on Church history, of which three volumes appeared during his life, and two more after his death, under the editorship of E. R. Redepenning (Bonn, 1823-52, 3 vols., in 8 parts, 4th ed of first four parts, 1844-48, 2d ed of fifth part, 1849, posthumous ed., vols. iv and v, 1854-55, Eng. trans., Edinburgh, 1846, 5 vols., with additions by H. B. Smith, New York, 1855-80, 5 vols.). Vol. vi (1856) contains his *Dogmengeschichte*. In 1831 Gieseler was called to a chair in Göttingen. Besides numerous contributions to periodicals and publications on contemporary questions, he edited Euthymius Zygabenus, *Narratio de Bogomilis* (Göttingen, 1842), as well as Petrus Siculus, *Historia Manichæorum seu Paulicianorum* (Göttingen, 1846). He died at Göttingen, July 8, 1854. For his life by Redepenning, consult vol v of his *Kirchengeschichte* (vol 1 of the Eng. trans. by Smith).

GIESSBACH (gēs'bak) **FALLS**. A picturesque cataract of Switzerland, in the Bernese

Oberland, falling into Lake Brienz (qv). It consists of seven cascades formed by the Giessbach stream during a descent of 980 feet from its source in the Schwarzhorn. The largest cascade has a fall of 190 feet.

GIESSEN, gēs'sen. A town of Hesse, capital of the Province of Upper Hesse, situated at the confluence of the Wieseck and the Lahn, 41 miles by rail north of Frankfurt (Map Germany, C 3). It has a number of fine modern churches, an old Rathaus, a barracks, and a university. The university, founded in 1607, was removed to Marburg in 1625 and reestablished at Giessen in 1650. It has four faculties (1535 students in 1913), a library of 261,747 volumes (1913), founded in 1617, a chemical laboratory arranged by Liebig (who was a professor here), botanical gardens, and several institutes and collections. Giessen has also a teachers' seminary, a gymnasium, and a school of agriculture. The chief trade of Giessen is in cigars and tobacco, employing more than 3000 hands, also lamps, furniture, safes, dyes, lacquer, varnish, machinery, metal products, textiles, chemicals, musical instruments. Pop., 1900, 25,491, 1910, 31,153, chiefly Protestants. Giessen dates from the twelfth century.

GIFFEN, gif'en, SIR ROBERT (1837-1910). An English statistician and economist. He was born at Strathaven, Lanarkshire, and was educated at the parish school in his native town, and at Glasgow College. In 1860 he began newspaper work as a reporter on the staff of the *Stirling Journal*. In 1862 he obtained a position on the London *Globe*, which he occupied until 1866, when he was engaged as assistant to John Morley, on the *Fortnightly Review*. From 1868 to 1876 he was the assistant editor and principal contributor to the *Economist*, under the editorship of Walter Bagehot, and served during part of the same time (from 1873 to 1876) as city editor of the London *Daily News*, for which he furnished the daily trade and financial article. In 1876 he was appointed chief of the statistical department of the Board of Trade. He continued to hold office after it was merged, in 1882, with that of assistant secretary of the Board of Trade. Another change in the organization of his department was made in 1892, when he was appointed comptroller general of the commercial, labor, and statistical departments. He retired in 1897. From 1882 to 1884 he was president of the Statistical Society. His writings include frequent contributions to the leading journals and magazines and the following publications: *American Railways as Investments* (1873), *Stock Exchange Securities* (1878), *Essays in Finance* (1st series, 1879, 2d series, 1884), *The Progress of the Working Classes in the Last Half Century* (1884), *The Growth of Capital* (1890), *The Case against Bimetallism* (1892), *Economic Inquiries and Studies* (2 vols., 1904).

GIFFORD, gif'fōrd, ADAM, LORD (1820-87). A Scottish jurist and philanthropist, born in Edinburgh. He was admitted to the Scottish bar in 1849, and in 1861 was appointed advocate deputy and in 1865 sheriff of Orkney and Zetland. In 1870 he became a judge of the Court of Sessions, with the title of Lord Gifford. He gave by his will £80,000 to endow (the Gifford) lectureships in natural theology at the four Scottish universities—Edinburgh, Glasgow, Aberdeen, and St Andrews.

GIFFORD, ROBERT SWAIN (1840-1905). An

American landscape painter and etcher. He was born on the island of Naushon, Gosnold (Mass.), and studied in New Bedford under A. van Beest, a Dutch painter, from whom he acquired a certain Dutch quality of style. He later traveled for purposes of study in Europe and northern Africa, and was one of the first Americans to choose subjects from those countries. His most characteristic landscapes, however, depict the seashore or the moorlands. They are well constructed, solidly painted, and full of virile sentiment, but unattractive in color. He was equally proficient in water colors and oils and became a member of the New York Water Color Society in 1865, making his home in New York for three years. In 1869 he visited California and Oregon. The Metropolitan Museum, New York, possesses "Near the Coast." Other good examples of his work are "After the Rain," "Coast of Vineyard Sound," and "Saltworks, Dartmouth," exhibited at the St. Louis Exposition (1904), "Cedar Tree Pasture and Ocean Sand Dunes," exhibited in 1905.

GIFFORD, SANFORD ROBINSON (1823-80). An American landscape painter. He was born at Greenfield, N. Y., July 10, 1823, and studied with the water-color painter John R. Smith of New York and was strongly influenced by Thomas Cole. In 1851 he was elected associate of the Academy and in 1854 Academician. He made a sketching tour through England and Scotland in 1855, then went to Paris, and in 1856 he visited Belgium, Holland, Switzerland, and Italy, spending the winter of the same year in Rome. The following year he spent in the Abruzzi, Naples, and Austria. Returning to New York at the beginning of the Civil War, he enlisted in the Seventh Regiment. He remained with the army through the years 1862-63. In 1866 he went west with Whittredge and Kensett, and in 1868 he visited Greece, Syria, Egypt, Turkey, and Italy. Gifford's pictures are expressive of the poetic and ideal qualities in landscape, they are rich and soft in color, and in them, for the first time in the American school, the interest is based entirely on artistic problems. Among the best are "Morning in the Adirondacks" (1867), "San Giorgio, Venice" (1878), "Fishing Boats on the Adriatic", "The Ruins of the Parthenon" (1880), Corcoran Gallery, Washington, "Tivoli" and "Near Palermo," in the Metropolitan Museum, New York.

GIFFORD, WILLIAM (1756-1826). An English author. He was born at Ashburton, Devonshire, in April, 1756. Left an orphan at 12, he was first a cabin boy and then an apprentice to a shoemaker. Aided by a local surgeon who had seen one of the boy's verses, he was sent to Exeter College, Oxford, where he was graduated B.A. in 1782. He now traveled on the Continent for "many years" as tutor to the son of Lord Grosvenor. His first publication was the *Baviad* (1794), a satire on the writers known as "Della Cruscans" (see DELLA CRUSCAN SCHOOL). This was followed by the *Mæviad* (1795), a similar satire on some of the contemporary dramatists, and by a savage attack on Dr. John Wolcot (qv), entitled *An Epistle to Peter Pindar* (1800). Wolcot retaliated with the feeble *Out at a Cobbler*. In 1802 appeared a translation of Juvenal, which Gifford had begun at the university, and to which he now prefixed an autobiography. Gifford, who had gained the favor of Canning and his political friends, edited the *Anti-Jacobin* in 1797-98,

and in 1809 he was appointed the first editor of the *Quarterly Review*. He was soon recognized as one of the severest reviewers of the time. Having no sympathy with the new schools of poets and critics, he attacked Hazlitt, Hunt, Lamb, Wordsworth, Shelley, and especially Keats, with great bitterness. (Consult review of Keats's "Endymion," in the *Quarterly*, April, 1818.) He resigned from the *Quarterly* in 1824, having amassed a fortune of £25,000. He died Dec. 31, 1826, and was buried in Westminster Abbey. Gifford is perhaps best known to scholars by his editions of Massinger, Ben Jonson, and Ford, and notes to Shirley used by Dyce in his edition of the dramatist. This work, however, was not done very carefully. The *Baviad* and the *Mæviad* are in *British Poets*, ed. by Frost (Philadelphia, 1838).

GIFT (AS, OHG. *gift*, from AS *gifan*, Goth *giban*, OHG. *geban*, Ger. *geben*, to give). Gift, in the broadest sense, includes every gratuitous transfer of property, whether real or personal, and whether made orally, by deed, or by will. As a specific legal term, however, it is limited to a present transfer of property without consideration. In this sense it is distinguishable from a devise or legacy on the one hand (which takes effect in the future, upon the giving owner's death) and from a barter, a grant, or a sale on the other, in each of which transactions a transfer is made upon a valuable consideration. Gifts are divisible into two classes, those *causa mortis* and those *inter vivos*. The first class has been discussed in the article on DONATION (qv).

It has been judicially declared that the elements necessary to the validity of a gift *inter vivos* are the following: (1) That the donor must be competent to contract, (2) there must be freedom of will, (3) the gift must be complete, with nothing left undone, (4) the property must be delivered by the donor and accepted by the donee, (5) the gift must go into immediate and absolute effect. If either of the first two elements is wanting, the gift may be avoided and the property regained by the donor, because of his legal incapacity to transfer property, or because he was the victim of fraud, duress, or undue influence. In case, however, all these essentials are present, the transfer becomes irrevocable as between the donor and donee. Even then, if it leaves the donor insolvent it may be set aside by his creditors as a fraudulent conveyance (qv).

The third essential of a gift—that it must be complete—distinguishes the transaction from a promise to give. A person makes a present of his promissory note for \$1000 to another. Here is no gift, only a promise to give. As a promise, it is unenforceable because there is no legal consideration for it. Had the donor presented the donee with the promissory note of a third person, a gift would have been consummated. Whether the delivery to another of the donor's check constitutes a gift of so much of his bank deposit as is named in the check, or is to be considered simply a promise to give, is a question upon which the courts are divided. The weight of authority is in favor of the latter view. Any substantial act on the part of the owner of property, tending to carry the gift into effect, and to give the donee dominion over the property so that he can appropriate it to his use, will amount to a valid and effectual gift. Accordingly a savings-bank deposit may be ef

factually given to another by delivering to the latter the deposit book accompanied by an assignment, or by other acts which disclose the donor's intention to presently pass title and vest the donee with dominion over the fund. Oftentimes a transaction which fails of effect as a gift is upheld by the courts as a declaration of trust (qv) in favor of the intended donee. This will not be done, as a rule, unless it is apparent that the owner of the property actually intended to create a trust.

Delivery of the property, which constitutes the fourth essential according to the judicial statement above referred to, may be actual or constructive, thus, if the property is already in the donee's possession, it is sufficient if the parties treat the property as thereafter owned as well as possessed by the donee. Neither does the law require actual acceptance by the donee in all cases. If the gift is wholly beneficial to him, his acceptance will be presumed until evidence of rejection by him is given. But it is in all cases essential that the possession of the property, if a chattel, shall be vested in the donee or, in lieu thereof, that a writing in the nature of a deed or a bill of sale be delivered to him. In the case of real property a gift is properly effected by delivery of a deed of conveyance.

The fifth requisite of a valid gift is that it go into immediate and absolute effect. The words of donation must be those of present, complete, and final transfer to the donee. Consult Kent, *Commentaries on American Law* (Boston, 1896), and the authorities referred to under CONTRACT.

GIFTS, CONDITIONAL. See DONIS CONDICIONABILIS.

GIFU, gē'fōō. A prefectural town of Japan, situated in the southern part of Nippon, 19 miles by rail from Nagoya (Map Japan, E 6). The chief products are silk and paper goods. Pop., 1903, 40,168, 1908, 41,488.

GIGANTISM. See ACROMEGALY.

GIGANTOMACHIA. See GIANTS, PERGAMON.

GIGNOUX, zhē'nyōō', FRANÇOIS RÉGIS (1816-82). A French landscape painter, born at Lyons. He studied art at Lyons and in the Ecole des Beaux-Arts in Paris and with Delaroche. In 1840 he came to the United States and became a member of the National Academy in 1851. He returned to France in 1870. His pictures are studies of nature in her more cheerful aspects and made quite a sensation in New York in the sixties. They reflect the methods of the French masters of his day and exercised considerable influence upon the younger generation. Among his productions are "Spring", "The First Snow", "The Indian Summer", "Niagara in Winter", "The Bernese Alps at Sunrise", "Niagara by Moonlight", "Mammoth Cave" (New York Historical Society), and "Winter Scene" (Corcoran Gallery, Washington). A number of his pictures are in private possession in New York City.

GIGOUX, zhē'gōō', JEAN (1806-94). A French historical and portrait painter and illustrator, born at Besançon. He was a pupil of the Besançon Academy and the Ecole des Beaux-Arts, Paris, and first exhibited in 1832. He soon became one of the strongest supporters of Delacroix in his revolt against idealism. His best painting is "The Death of Leonardo da Vinci" (1835), in the Museum of Besançon.

It is a solidly painted, well-colored, realistic conception of the scene. These traits characterize his other works "The Death of Cleopatra" (Bordeaux Museum), "The Eve of Austelitz" (Besançon Museum), "The Capture of Ghent" (Versailles), "A Young Girl" (Compiègne Museum), and the portraits of Fourier and General Dwernich, both in the Louvre. Realism is also the dominant note in his religious paintings in Saint-Germain-Auxerrois and Saint-Gervais. His drawings include 600 designs on wood for an edition of *Gil Blas*. His collection of drawings and lithographs was left to his native town. He wrote an interesting book, *Causeries sur les artistes de mon temps* (1855), full of anecdote and art talk. He received the medal of honor at the Paris Exposition of 1889 and the cross of the Legion of Honor in 1880.

GIGUE, zhāg. See JIG.

GIHON, gī'hōn, ALBERT LEARY (1833-1901). An American physician, born in Philadelphia. Graduating in 1852 at the College of Medicine and Surgery in that city, he remained for two years as professor of chemistry and toxicology. He became an assistant surgeon in the United States navy in 1855, surgeon in 1861, and medical director in 1879. In 1895 he became senior medical director of the navy and in the same year was retired with rank of commodore. He designed the model hospital ship exhibited at the Centennial Exhibition of 1876 and invented an ambulance cot, adopted in 1877 under his name, for use in the navy. At various times he was president of the American Public Health Association, the American Academy of Medicine, and the Association of Military Surgeons of the United States. He wrote *Practical Suggestions in Naval Hygiene* (1871), and many papers, reports, and fugitive articles.

GIJÓN, hē'hōn'. An important seaport in the Province of Oviedo, Spain, on the Bay of Biscay, 20 miles by rail north-northeast of the city of Oviedo (Map Spain, C 1). One of the most flourishing towns of Asturias, its population has increased with the development of its commerce and its growing popularity as a watering place. The town is well built, the more modern quarters with wide, straight streets and a number of new buildings, including markets, and a town hall, but the old section towards Santa Catalina Point is walled and has many quaint mediæval buildings. There are statues in honor of Pelayo and Gaspar de Jovellanos, the latter a native of Gijón, who in 1794 founded the Instituto Jovellanos, which has a valuable art collection and a library of 5500 volumes, and the Campos Elíseos with a theatre, circus, and extensive gardens. Gijón has also a large bull ring and fine promenades, the parish church of San Pedro (fifteenth century) and the two palaces are also interesting. One of the old ecclesiastical buildings has been converted into a government tobacco factory which employs 1400 persons. The manufacturing establishments comprise also glass and pottery works, foundries and machine shops, wire and wire-nail factories, and petroleum refineries, soap, preserved foods, candles, and chocolate are made in Gijón. The town, including a considerable area that is chiefly mountainous, is the chief port for the rich mining districts of Oviedo and carries on an extensive export trade in coal, copper, iron, and other minerals, lumber, and nuts. The coastwise trade is also important, and there are large fisheries. Increased railroad facil-

ties and improvements in the harbor have promoted its commerce. Pop., 1900, 47,326, 1910, 52,226. Gijón is identified with the ancient Gigia, or Gijia, though not on the exact site of the Roman town. Captured by the Arabs, it fell into the hands of Pelayo after the battle of Covadonga, in 722, and until near the close of the eighth century was the capital of the Asturian princes. The shattered "Invincible Armada" repaired here in 1588.

GILA (ē'la) **MONSTER** (after the *Gila*, a river in Arizona.) A poisonous lizard (*Heloderma suspectum*) found in the sandy deserts of Arizona, New Mexico, and Texas. It is one of the largest lizards in North America, is closely allied to the caltetepon (*Heloderma horridum*) of Mexico, and is fat, inactive, and stupid. It is covered with bright orange and black pebble-like scales, and, like snakes, it has grooved teeth with large salivary glands at their bases. Its bite is injurious, though not often fatal to man. Drs. S. Weir Mitchell and E. F. Reichert found that the saliva injected into pigeons and fowls was quickly mortal, but the experiments of Dr. Irwin of the United States army (1862-63), of Dr. H. C. Yarrow of the United States National Museum, and of Samuel Garman, have failed to substantiate the earlier conclusions, so that the question of the poisonous nature of this lizard is not definitely settled. An illustrated monograph upon its anatomy was contributed by Shufeldt to the Zoological Society of London and printed in their *Proceedings* (London, 1900). See **HELODERMA**, and **Plate of IGUANA and OTHER AMERICAN LIZARDS**.

GILA (he'la) **RIVER**. A river of the United States, which, rising in the Sierra Madre Mountains (qv) in New Mexico, and, flowing in a westerly direction across Arizona, joins the Colorado about 120 miles above where the latter empties into the Gulf of California (Map Arizona, C 4). For the greater part of its length, which is nearly 500 miles, the Gila flows through mountain cañons, the sides of which are in many places so precipitous as to render the stream almost unapproachable. The lower part of its course is through an open and comparatively level country, much of which is made fertile by irrigation from the river. Ruined edifices, one of which is three stories high and in a fair state of preservation, broken pottery, and traces of irrigation canals along its banks show that its riparian dwellers of former times were numerous and partly civilized. About 200 miles from its mouth, in a productive portion of the valley, is the reservation of the Pima and Maricopa Indians.

GILAN, gē-lan'. See **GHILAN**.

GILBERT, gil'bért, ALFRED (1854-) An eminent English sculptor and goldsmith. He was born in London, the son of a distinguished musician, and studied under Boehm, at the South Kensington Art Schools, and under Cavalier at the Ecole des Beaux-Arts, Paris. His individual style was formed in Florence and Rome, where he was profoundly impressed by the Renaissance sculptors. Gilbert took rank as the most original sculptor of the late nineteenth and early twentieth century in Great Britain, and his influence on the art of his native land has been profound and wholesome. He excels especially in the art of metal work, which he did most to revive in England. In this regard, as well as in his sculpture, he has aptly been compared to Benvenuto Cellini. Like him he excels in deco-

ration, sometimes indeed to the detriment of his sculpture, the effect of which is interfered with by his love of ornament. Although somewhat minutely executed, his work abounds in color and in rhythm. He has an acute sense of beauty and an imaginative fancy and exaggeratedly high ideals, which have often caused him to destroy fine creations. His early sculptures, which are chiefly ideal, include "Mother and Child", "The Kiss of Victory" (1882), "Perseus" (1883, showing the influence of Florentine sculpture), "Study of a Head", "Icarus" (1884), an admirable nude. In 1888 he modeled the seated statue of Queen Victoria for Winchester, perhaps the most remarkable work of its kind in Great Britain. His portraits, which interpret the spiritual as well as the physical, include busts of Dr. Joule (City Hall, Manchester), G. F. Watts, Sir Henry Tate, and statues of Lord Reay (Bombay) and John Howard at Bedford. Among his monumental works are the strikingly original Fawcett Memorial in Westminster Abbey, the less successful Shaftesbury Memorial Fountain in Piccadilly Circus, London, the Caldecott Memorial in the crypt of St. Paul's, a memorial baptismal font (1900), and his greatest achievement, the tomb of the Duke of Clarence in Windsor Chapel. As a goldsmith, he produced many beautiful works, including the epergne presented to Queen Victoria on her Jubilee, chains, statuettes, and other small objects. Gilbert was elected to the Royal Academy in 1892 and appointed professor of sculpture in 1900, but resigned from the Academy in 1909. In 1897 he was made a member of the Victorian Order. He entered on a life of almost monastic seclusion in Bruges. Consult Hatton, *The Life and Work of Alfred Gilbert* (London, 1903).

GILBERT, MRS. ANNE HARTLEY (1821-1904). A popular American actress. She was born in Lancashire, England, and in her youth became a dancer. In 1846 she was married to George H. Gilbert, with whom, after appearing in many of the British theatres, she came to America in 1849. Her first hit in a speaking part was as Wicahavenda in Broughman's *Pocahontas* (1857). In 1869 she joined Daly's company and became well known in the characters of the odd elderly ladies of the stage, such as Mrs. Candour in *The School for Scandal*, Mrs. Harcastle in *She Stoops to Conquer*, and many others. After Mr. Daly's death she came under Charles Frohman's management and later became a member of Annie Russell's company. Mrs. Gilbert published her stage reminiscences in 1901. Consult W. Winter, *The Wallet of Time* (2 vols., New York, 1913).

GILBERT, CASS (1859-). A distinguished American architect, born at Zanesville, Ohio, and educated at Massachusetts Institute of Technology. He began practice in 1883. His greatest achievement is the Woolworth Building, New York. Among other buildings planned by him are the Minnesota Capitol, at St. Paul, Essex County Court House, Newark, N. J., Agricultural Building at the Omaha Exposition (1897), Brazer Building in Boston, New York Custom House, Art Building and Festival Hall at the St. Louis Exposition, and the Central Public Library, St. Louis. He also made the general plans for the universities of Minnesota and Texas and the Arkansas Capitol, and was one of the architects of the new Union Club in New York. He was appointed by President

Roosevelt to the Council of the Fine Arts and by President Taft to the Commission of Fine Arts, was one of the founders, and a president, of the Architectural League, New York, and president of the American Institute of Architects in 1908-09, and was elected a member of the National Academy in 1908, and of the American Academy of Arts and Letters in 1914, besides receiving notable recognition abroad.

GILBERT, CHARLES BENAJAH (1855-) An American educator, born at Wilton, Conn. He graduated at Williams College in 1876 and was principal of high schools at Mankato, Winona, and St Paul, Minn., and Beaver Dam and Oshkosh, Wis. From 1889 to 1896 he was superintendent of schools at St Paul, from 1896 to 1900 at Newark, N J., and from 1900 to 1903 at Rochester, N Y. In 1903-04 he edited educational publications. He was president of the National Association of School Superintendents in 1897 and in 1897-1900 lectured at Teachers College, Columbia University. In 1906 he became lecturer on education in Western Reserve University. He wrote *The School and its Life* (1906) and *What Children Study and Why* (1913). He also compiled, or directed the preparation of, *American School Readers* (7 vols.), *Arithmetic* (3 vols.), *Stepping Stones to Literature* (8 vols.), *Stories of Heroes* (6 vols.), and other publications.

GILBERT, CHARLES HENRY (1859-) An American ichthyologist, born at Rockford, Ill. He graduated from Butler University in 1879 and studied also at Indiana University (Ph D, 1883), where he taught in 1880-84, and to which he returned, after several years at the University of Cincinnati, to be professor of zoology in 1889-91. After 1891 he was professor of zoology at Leland Stanford. He was connected with the United States Fish Commission in 1880-98, and in 1902 and 1906 made important explorations for it, and for the Bureau of Fisheries he conducted salmon investigations in 1909-13. His publications include *Synopsis of the Fishes of North America*, with David Starr Jordan (1882), *The Deep Sea Fishes* (of the Hawaiian Islands) (1905), *Lantern-Fishes of Japan* (1913), and official reports and bulletins.

GILBERT, DAVID MCCONAUGHY (1836-1905). An American clergyman and author, born at Gettysburg, Pa. He studied there at Pennsylvania College and the theological seminary of the Lutheran church and was ordained in 1860 a Lutheran minister. He was pastor at Staunton, Va., in 1859-63 and 1871-73, at Savannah, Ga., in 1863-71, and at Winchester, Va., after 1873. In 1886 he was elected first president of the United Southern Synod of the Lutheran Church. Among his publications are *The Lutheran Church in Virginia, 1776-1876* (1876), *The Synod of Virginia Its History and Work* (1879), *The Annihilation Theory Briefly Examined* (1879).

GILBERT, gil'bért, GROVE KARL (1843-1918). An American geologist, born in Rochester, N. Y. He graduated from the university in that city in 1862. For several years he studied geology and paleontology with Prof H. A. Ward, of Rochester, supplementing his studies by field work with the Ohio Geological State Survey in the capacity of assistant. In 1871 he received an appointment to the United States Geological Survey. As assistant to Major J. W. Powell, the director of the Survey, he

was engaged from 1875 to 1879 in mapping and describing the geology of portions of the Rocky Mountain region. Entering the service of the United States Geological Survey in 1879, from 1889 to 1892 he was chief geologist. He was special lecturer at Cornell (1886), Columbia (1892), and Johns Hopkins (1895-96). In 1885 and 1886 he was president of the American Society of Naturalists, in 1899 president of the National Academy of Sciences, and in 1892 and 1909 president of the Geological Society of America. One of the first to study the relations between geological structure and surface features, a branch of science now known as physiography, he wrote *Report on the Geology of the Henry Mountains* (1877), *Report on the Geology and Resources of the Black Hills of Dakota* (1880), *The Topographic Features of Lake Shores* (1885), *Lake Bonneville* (1890), *Introduction to Physical Geography* (1902, new ed, 1908), *Glaciers and Glaciation* (1904), being vol. in of the report of the Harriman Alaska expedition.

GILBERT, SIR HUMPHREY (1539-83). An English soldier and navigator. He was born at Compton, Devonshire, and was, on his mother's side, a half brother of Sir Walter Raleigh. He was educated at Eton and at Oxford. He saw active service in Normandy under the Earl of Warwick in 1563 as well as in the Irish campaigns of 1566-70. In 1566 he joined Anthony Jenkinson in a petition to the Queen regarding a project for the discovery of a northeast passage to Cathay, and the year following he petitioned alone regarding an attempt to find a northwest passage. In 1572 he was sent into the Netherlands with a force of 1500 English volunteers to aid the Dutch. After a futile campaign he returned to England and spent the next five years in retirement in "sundry profitable and very commendable exercises" in literature. During this period he wrote the *Discourse of a Discovery for a New Passage to Cathay*, produced partly in support of his petition of 1566. The *Discourse*, with some additions, was edited by the poet George Gascoigne in 1576. In 1577 Gilbert published another treatise, suggesting a plan of "repairs" against the King of Spain, and in 1578 he received a commission from Elizabeth, which covered the privileges of discovery and colonization. An expedition was immediately fitted out by Gilbert and Sir Walter Raleigh, but was dispersed by the Spaniards off Cape Verde, and the next four years were spent by the indefatigable adventurer in endeavors to raise the necessary funds for another undertaking. On June 11, 1583, he sailed from Plymouth with five ships, but the largest—a bark furnished by Raleigh—returned to England after two days at sea. Gilbert made his way across the Atlantic, and on July 30 reached the coast of Newfoundland, and determined to plant his colony near the harbor of St John's, where he took possession of the country in the name of the Queen. This, the first English colony in America, was made up of broken-down gentlemen and seamen, and the lawlessness of the community was beyond Gilbert's control. Arrangements were made to return to England, whence Gilbert hoped to make another attempt at colonization in the following spring. Meanwhile he explored the coast of Newfoundland towards the south and lost his largest ship on the shoals off Cape Sable or Cape Breton Island. Disregarding the advice of his friends, he persisted in sailing in the

Squirrel, the smaller and less seaworthy of the two remaining vessels. A storm was encountered off the Azores. "On Monday, September 9th," reports Hayes, the captain of the other vessel, the *Golden Hind*, "the frigate was near cast away, yet at that time recovered, and giving forth signs of joy, the general, sitting abaft with a book in his hand, cried out unto us in the *Hind* 'We are as near to heaven by sea as by land.' That same night the watch on board the *Hind*, observing that the frigate's lights suddenly disappeared, cried out 'The general was cast away,' which was too true, for in that moment the frigate was devoured and swallowed up in the sea." Consult Bourne, *English Seamen under the Tudors* (London, 1868), and Markham, *The Fighting Veres* (ib, 1888). The original narrative of his voyage is in Hakluyt, *English Voyages* (ib, 1600, new ed, 1812, Goldschmidt, Edinburgh, 1889). Consult also Adams, *English Heroes in the Reign of Elizabeth* (Edinburgh, 1902), and Slafter, *Sir Humfrey Gylberte and his Enterprise* (Boston, 1903).

GILBERT, JAMES ELEAZER (1839-1909). An American Methodist Episcopal clergyman, born in Alexander, N. Y., and educated at Genesee College. He was city editor of the *Buffalo Courier*, associate editor of the *Buffalo Christian Advocate*, and editor of the *Sunday School Standard*. He also served as principal of public schools at Buffalo and at Dayton, Ohio. Entering the ministry in 1872, he thereafter held pastorates at Cincinnati, Ohio, Lexington, Ky., Topeka, Kans., Milwaukee, Wis., Grand Rapids, Mich., and Indianapolis, Ind. He founded the *Kansas Methodist* at Topeka, and established the Teachers' Normal College at Milwaukee. In 1889 he organized and became president of the American Society of Religious Education. He is author of *Preparation for Church Membership* (1903), *Religious Experience* (1904), *Biblical Doctrine* (1904), *American Methodism* (1904).

GILBERT, SIR JOHN (1817-97). An English historical painter, illustrator, and engraver. He was born at Blackheath, July 21, 1817. He learned every technique possible for art expression—oils, water color, fresco, wood and stone engraving, etching, carving, and drawing—and was in the main self-taught, except for a few lessons in the use of color from George Lance. Gilbert gave most of his attention to illustration, in 1838 beginning with illustrations of a book of nursery rhymes. These were followed by illustrations for the editions of the poets—Cowper (1841), Pope, Burns, and others included in Routledge's *British Poets* (1853), *Evangeline* (1856), Longfellow's *Poems* (1858), Scott (1857), Wordsworth (1859), Milton (1864). His chief work was 829 illustrations for Howard Staunton's edition of Shakespeare (1856-60), the proofs of which are in the collections of the British Museum. He also illustrated numerous religious books, novels, children's tales, and anthologies.

In 1843 he sent a few drawings to *Punch*, designing the cover for that year, but for 30 years, following the establishment of the *Illustrated London News* in 1842, he was a constant contributor, furnishing it about 30,000 woodcuts. He also drew for the *London Journal*. In 1852 he was elected an associate of the Water-Color Society and a full member in 1854. He initiated the exhibitions of this society in 1862, leading the way to a regular winter exhibition

Gilbert was made president of the society in 1871, on which occasion he was knighted. His oil paintings were exhibited at the British Institution and the Royal Academy, of which he was appointed a member in 1876. Among the best are "Rembrandt" (1867), "Naseby" (1873), "Richard II Resigning the Crown" (Liverpool Gallery), "Doge and Senators of Science," and several subjects from *Don Quixote*. In 1893 he presented to the nation a collection of his works, which were divided among the galleries in London, Birmingham, Liverpool, and Manchester. To the Royal Academy he presented his sketch-books. His life was uneventful, his industry was marvelous, as the prodigious number of his drawings and paintings testifies. He died at Blackheath, Oct. 5, 1897. He was a great draftsman and illustrator rather than a painter, although he was a good colorist, with a fondness for red, yet he often made his shadows too black. Consult Spielman, "Sir John Gilbert," in the *Magazine of Art* (London, 1898), and Atkinson, *English Artists of the Present Day* (ib, 1872).

GILBERT, JOHN GIBBS (1810-89). An American comedian, whose real name was Gibbs. Born in Boston, he made his first appearance there at the Tremont Theatre, in 1828, as Jaffier in *Venice Preserved*. His original aim was to be a tragedian, but while on a tour through the South and West, the success of his *Sir Anthony Absolute*, *Master Walter*, etc., convinced him that his true bent was for "old men" parts, and he soon became the leading American actor in that line of comedy. In 1847 he had a successful engagement in London. From 1862 until the close of Wallack's Theatre, New York, he was connected with that house. His most famous rôle was that of Sir Peter Teazle in *The School for Scandal*, his *Sir Anthony*, *Old Dornton* in *The Road to Ruin*, and *Lord Ogleby* in *The Clandestine Marriage*, were also noted. Consult Winter, "A Sketch of the Life of John Gilbert," *Dunlap Society Publications* (New York, 1890), McKay and Wingate, *Famous American Actors of To-Day* (ib, 1896), Carroll, *Twelve Americans Their Lives and Times* (ib, 1893).

GILBERT, SIR JOHN THOMAS (1829-98). An Irish antiquary, born in Dublin. He received his education at Bective College in Dublin and at Prior Park College in Bath. His antiquarian tastes developed early. In 1855 he became one of the honorary secretaries to the Irish Celtic and Archaeological Society and took an active part in organizing the new public record office at Dublin, of which he was appointed secretary (1865-75). In 1855 he was elected to the Royal Irish Academy, of which he was librarian for a quarter of a century and finally vice president. He also held many positions of public trust. In 1892 he received the degree of LL.D. from the Royal University, and in 1897 he was knighted. Gilbert's researches in the sources of Irish history are of the very highest value. Among his works are *Historical Essays on Ireland* (1851), *Celtic Records and Historical Records* (1852), *History of the City of Dublin* (3 vols, 1854-59), *Ancient Historical Irish Manuscripts* (1861), *Public Records of Ireland* (1863), which consists of a letter addressed to the Lords Commissioners of the Treasury on the condition of the public records, and was followed by a work of a similar nature entitled *Records Revelations Resumed* (London,

1864), *History of the Viceroy's of Ireland* (1865), *A Contemporary History of Affairs in Ireland from 1641 to 1652* (1879-80, 4 vols), *Account of Facsimiles of National Manuscripts of Ireland* (5 vols, 1874-84), *Chartularies of St Mary's Abbey, Dublin* (2 vols, London, 1884), containing also the register of its house at Dumbrody and the *Annals of Ireland, History of the Irish Confederation and War in Ireland, 1641-1649* (7 vols, 1882-91), *Calendar of Ancient Records of Dublin* (8 vols, 1889-98), *A Jacobite Narrative of the War in Ireland* (1892), *Documents Relating to Ireland* (1893), *Crede Mihi, the Most Ancient Register of the Archbishops of Dublin before the Reformation, A.D. 1275* (1897). He also edited numerous volumes of manuscripts of the Earl of Charlemont (1891-94), of Trinity College (1881), of the Earl of Fingall (1885), of Charles Haliday (1897), and many others. Consult Gilbert, *Life of Sir John T. Gilbert* (2 vols, London, 1905).

GILBERT, SIR JOSEPH HENRY (1817-1901). An English agricultural scientist, born at Hull (Yorkshire), son of Joseph Gilbert (1779-1852), a well-known Congregational minister, and of Ann Taylor, the author, with her sister Jane, of *Original Poems for Infant Minds* and *Hymns*. He studied at Glasgow University, at University College, London, and at the laboratory of Liebig, University of Giessen, and in 1840-43 was successively assistant to Prof. A. T. Thompson at University College and chemist to a calico manufactory near Manchester. In 1843 he became associated with Mr (later Sir) J. B. Lawes (qv) in the agricultural experiment station established upon Lawes's estate at Rothamsted (near St Albans, Hertfordshire). He was director of the laboratory from 1843 until the death of Lawes in 1900 and then director of the station. He was professor of rural economy at Oxford in 1884-90. In 1860 he was elected a fellow of the Royal Society and in 1882-83 was president of the Chemical Society, of which he had been elected a member in 1841. He traveled in the United States in 1882, 1884, and 1893. The combined services of himself and Lawes to the development of agricultural chemistry, dating from the establishment of the Rothamsted station, one of the first of such institutions, have been epoch-making. He was knighted in 1893, 50 years after the beginning of the Rothamsted experiments. In addition to a large number of essays prepared with Lawes for the *Journal of the Royal Agricultural Society of England*, the *Journal of the Chemical Society*, the *Transactions of the Royal Society*, and various other periodicals and reports, he wrote *Amount and Composition of the Rain and Drainage Waters at Rothamsted* (1882, with Lawes and Warrington) and *Agricultural Investigations at Rothamsted, England, during a Period of Fifty Years* (1895, Bulletin 22 of the United States Office of Experiment Station).

GILBERT, LINDA (1847-95). An American philanthropist. She was born in Rochester, N. Y., but when very young was taken by her parents to Chicago, where she was educated in St Mary's Convent. She became interested in the cause of prison reform, and through her efforts libraries aggregating 30,000 volumes, and ranging from 1500 to 2000 volumes each, were placed in various prisons throughout the country. She was also instrumental in bringing about the incorporation of the Gilbert Library and Prisoners'

Aid Society, under the laws of the State of New York, having for its object the improvement of prison discipline, the placing of selected libraries in every prison and jail, the care of prisoners' families when in need, and the assistance of those discharged from prison. The greater part of her work was done in her individual capacity, the society, through lack of funds, having been prevented from proceeding far with the work for which it was organized.

GILBERT, zhe'l'bâr', LOUIS PHILIPPE (1832-92). A Belgian mathematician, born at Beauring (Namur). He was a professor at the University of Louvain, a member of the Royal Academy of Belgium, and a correspondent of the Institute of France. His published works, chiefly on pure mathematics and their history, include a *Cours de mécanique analytique* (1877) and *Recherches sur les propriétés géométriques des mouvements plans* (1878).

GILBERT, NICOLAS JOSEPH FLORENT (1751-80). A French poet, born at Fontenay-le-Château, Lorraine. He had already written some mediocre verse and a novel when he went to Paris in 1772. He presented a poem at the Academy, which was not well received. He wrote the satires *Le dix-huitième siècle* (1775) and *Mon apologie* (1778), some odes, and a few days before his death his best-known poem, "Adieux à la vie." He has been called the French Juvenal and a French Chatterton, and it was said that he died of want, but he was in receipt of three pensions at the time. Alfred de Vigny made a hero of him in *Stello*. His complete works were first published in 1788, and they have several times been reprinted—in 1882 by Lescure. Consult Laffay, *Le poète Gilbert* (Paris, 1898), and Schmit's "Notice" in *Mémoires de la Société d'Archéologie Lorraine*, vol. xi (Nancy, 1890).

GILBERT, gil'bért, RUFUS HENRY (1832-85). An American physician and inventor. After graduating at the College of Physicians and Surgeons in New York City, he began medical practice at Corning, N. Y. At the outbreak of the Civil War he became a surgeon in the Duryea Zouaves (Fifth New York Infantry) and rose to be medical director and superintendent of the Central Railroad of New Jersey. Afterward he made a study of the rapid-transit problem in New York City, as a result of which he devised the elevated railway, originally in tubular pneumatic form, but afterward more nearly resembling the present system. Under his direction the Sixth Avenue Elevated Railway (in New York City), then known as the Gilbert Elevated Railway, was constructed. In 1878 the management of the railway was assumed by the Metropolitan Transit Company. Charges of fraud were subsequently made by Dr Gilbert against his associates, and much litigation followed.

GILBERT, SAINT See GILBERTINES

GILBERT, WILLIAM (1540-1603). A distinguished English natural philosopher and physician, who has been termed "the father of magnetic philosophy." He was born at Colchester, of which town his father was recorder. He was a member and subsequently fellow of St John's College, Cambridge, was B.A. in 1560, M.A. in 1564, and M.D. in 1569. About the year 1573 he settled in London as a practicing physician, joined the College of Physicians, and was appointed physician to Queen Elizabeth. The time that he could spare from the duties of his pro-

fession was employed in philosophical experiments, particularly in relation to the magnet, and in these he was assisted by a pension from the Queen. After holding various offices in the College of Physicians he was finally elected its president in 1600. At the death of the Queen in 1603 he was continued in his office of court physician by James I until his death, a few months later. Gilbert's death seems to have taken place in London, but he was buried at Colchester, in the church of the Holy Trinity, where there is a monument to his memory. He left his library, globes, instruments, and cabinet of minerals to the College of Physicians. From his birthplace, he is generally designated as Gilbert of Colchester. His important works are *De Magnete, Magneticisque Corporibus, et de Magno Magnete, Tellure, Physiologia Nova* (1600), of which there are several editions, and *De Mundo Nostro Sublunari Philosophia Nova* (1651), published from a manuscript in the library of Sir William Boswell. The first of these works has served as the basis of subsequent investigations in terrestrial magnetism and contained all the fundamental facts of the science as they were known at that time. Gilbert establishes the magnetic nature of the earth, which he regards as one great magnet, and discusses variations and the bearing of magnetic phenomena on navigation. He was the first to use the terms "electric force," "electric attraction," and "magnetic pole," and to point out that amber is not the only substance which, when rubbed, attracts light objects, but that the same faculty belongs to the resins, sealing wax, sulphur, glass, etc. These substances he termed "electrics," while the metals and other material which would not exert the force of attraction upon being rubbed he called nonelectrics. The publication of his treatise *De Magnete*, which was the first great work on physical science to be published in England, will always be regarded as constituting an epoch in the history of magnetism and the allied sciences. Consult William Gilbert of Colchester, *On the Loadstone and Magnetic Bodies, and on the Great Magnet, the Earth*, trans. by Mottelay (London, 1893), which contains a biographical memoir, also another translation with notes by S. P. Thompson, published by the Gilbert Club of London (ib, 1900).

GILBERT, SIR WILLIAM SCHWENCK (1836-1911). An English dramatist, best known for the comic operas in which he collaborated with the composer, Sir Arthur Sullivan. He was born in London and graduated at London University. From 1857 to 1862 he was a clerk in the Privy Council office, in 1864 he was called to the bar of the Inner Temple. He had been a contributor to *Fun* (for which he wrote his well-known *Bab Ballads*) and to other periodicals for several years, when in 1866 he wrote his first play, a burlesque called *Dulcamara*. It was the first of a long list. Among his comedies, after such light pieces as *The Merry Zingara* and others, came *The Palace of Truth* (1870), *Pygmalion and Galatea* (1871), *The Wicked World* (1873), *Sweethearts* (1874), *Broken Hearts* (1876), *Dan'l Druce and Engaged* (1877). In 1871 he and Arthur Sullivan began to work together. Their most famous pieces are *H. M. S. Pinafore* (1878); *The Pirates of Penzance* (1879); *Patience, or Bunthorne's Bride* (1881), *Iolanthe* (1882), *The Mikado* (1885), *The Gondoliers* (1889). In 1891 Gil-

bert published a collection of his songs under the title *Songs of a Savoyard* (reprinted in 1897). *The Mountebanks* he produced in 1892 with Alfred Cellier, *His Excellency* and *The Grand Duke* are among later productions. He was knighted in 1907. Consult W. Winter, *The Wallet of Time* (2 vols., New York, 1913).

GILBERT DE LA PORRÉE, zhél'bâr' de la pò'râ', or, in Latinized form, GILBERTUS PORRETANUS (1070-1154). A scholastic theologian. He was born at Portiers, France, 1070, educated at Chartres, and became Bishop of Portiers in 1142. He was accused of heresy regarding the Trinity by Bernard of Clairvaux and was tried at Rheims (1148). On promising to correct his errors he was allowed to go free. He was influential in introducing the Aristotelian philosophy. His chief works were a *Commentary* on Boethius on the Trinity, and *The Sea Principus*, long used as a textbook of the Aristotelian principles. Both are printed in Migne, *Patrol. Lat.*, lxiv and clxxxviii. Consult his life by Berthaud (Paris, 1892).

GILBERTINES, gil'bër-tînz. An English religious order, founded about 1130 by St. Gilbert, a native of Sempringham in Lincolnshire. He first established a convent of seven nuns, besides lay sisters, and prescribed for them the Benedictine rule. He intended to place them under the direction of the Cistercians, but when (1147) this did not seem practicable he founded a congregation of priests and lay brothers to have the care of the nuns, while dwelling in a separate cloister. To these he gave the rule of St. Augustine modified by Cistercian discipline. The foundation was confirmed by Eugenius III in 1148, and at the founder's death in 1189 had 13 cloisters, of which nine were double. It continued to flourish until the dissolution of the monasteries. Consult Graham, *Saint Gilbert of Sempringham and the Gilbertines* (London, 1901), and Gasquet, *Henry VIII and the English Monasteries* (ib, 1899).

GILBERT ISLANDS. An archipelago in Oceania, situated on the equator and between long 172° and 177° E, southeast of Marshall Islands (Map Australasia, K 2). It consists of 18 small inhabited islands, mostly atolls, covering a total area of about 166 square miles. The largest of them are Tapiteuea, Arorai, Nonuti, Apamama, Maiana, and Maraki. The climate is favorable. The chief product of the group is copra. The population, stated in 1911 at 26,871, is chiefly natives imperfectly civilized, but including a number of converts to Christianity, they are a Micronesian people, but with a strong admixture of Polynesian, the source of this contamination being identifiable on linguistic grounds as Samoan. Sixteen of the islands form two groups designated Ni-Makin and Ni-Peru, distant western outliers are Paa-napa and Nauru, the site of extensive phosphate digging, the latter a German possession. The group was first discovered by Saavedra in 1529 and rediscovered by John Byron in 1765. They came into British possession in 1892 and are administered by the High Commissioner of the Western Pacific in Fiji through a resident deputy. Consult Kramer, *Hawan, Ostmikronesien und Samoa* (Stuttgart, 1906); Elschner, *Carallogene-Phosphat-inseln* (Hamburg, 1913); Bingham, *Gilbertese-English Dictionary* (Boston, 1908).

GILBERTON. A borough in Schuylkill Co., Pa., 4 miles west by south of Mahanoy City, on

the Philadelphia and Reading, and the Pennsylvania railroads (Map Pennsylvania, J 5) It has extensive coal mines Pop, 1900, 4373, 1910, 5401

GILBERTUS PORRETANUS. See GILBERT DE LA PORRÉE

GILBEY, SIR WALTER (1831-1914) A British wine merchant and horse breeder He was born at Bishop Stortford, Hertfordshire, England, began life in an estate agent's office, subsequently obtained a clerkship in a parliamentary agent's office, and during the Crimean War served in the convalescent hospital at the Dardanelles Returning to London, he set up a retail wine and spirit trade with his brother Alfred in 1857 and thereby accumulated a large fortune He was knighted in 1893 Gilbey was president of the Shire Horse Society in 1883 and 1897, of the Hackney Horse Society from 1889 to 1904, and of the Royal Agricultural Society in 1895 He published *The Harness Horse* (1898), *Animal Painters in England from 1650* (2 vols, 1900); *Thoroughbred and Other Ponies* (1903), *Hunter Sires* (1903), *Poultry Keeping* (1904); *Horses, Breeding to Color* (1907), *Pig in Health* (1910), *Sport in the Olden Time* (1912), *Hounds in the Old Days* (1913).

GIL BLAS, zhél blas See LE SAGE

GILBOA, gil-bō'a (perhaps an early corruption of Heb *gib'ath habba'al*, hill of Baal) The biblical name of a range of hills on the eastern side of the plain of Esdraelon (qv) Their height varies from a few hundred to 2000 feet The hills were the scene of the death of King Saul and his three sons, after their defeat by the Philistines (1 Sam xxxi, 2 Sam i 6, 1 Chron x 1-8). The modern name of the hills is Jebel Fuku'a

GILBRETH, FRANK BUNKER (1868-). An American contracting engineer, born at Fairfield, Me. He practiced in Boston from 1895 to 1904 and after that in New York City. He became director of the Summer School of Management for Professors of Engineering and Economics Deeply interested in problems of efficiency, he founded international museums for elimination of unnecessary fatigue among workers and introduced micromotion study and processes for determining efficient methods of work His publications include *Field System* (1908), *Concrete System* (1908), *Bricklaying System* (1909), *Motion Study* (1911), *Primer of Scientific Management* (1912), and, with his wife, *Time Study, the Science of Obtaining Methods of Least Waste*

GILCHRIST, gil'krist, ALEXANDER (1828-61) An English biographer, born in London He studied law at the Middle Temple and was called to the bar in 1849, but relinquished a legal career for that of a man of letters His contributions to the *Eclectic Review*, the *Literary Gazette*, and the *Critic* were numerous. His chief work is his *Life of William Blake* (1863). He wrote also a *Life of William Pitt, RA* (2 vols, 1855) He was a friend of D G Rossetti and of Carlyle, to whom he was for many years a next-door neighbor in Cheyne Row Consult *Memoir of Alexander Gilchrist*, prefixed to the second edition of the *Life of Blake* (London, 1880)

GILCHRIST, WILLIAM WALLACE (1846-1916) An American organist, choral conductor, and composer, born in Jersey City, N J He studied music under Professor Clarke at the University of Pennsylvania and afterward took

up the profession of teaching, in which he was eminently successful From 1873 to 1877 he was choirmaster of St Clement's Church, Philadelphia, from which he went to Christ's Church, Germantown, as organist and choirmaster In 1882 he joined the faculty of the Philadelphia Musical Academy and in the same year won the prize in composition at the Cincinnati Musical Festival with his *Psalm XLVI*, written for solos, chorus, orchestra, and organ Two years before he had won the Mendelssohn Glee Club (New York) prize, with the composition *Autumn Dreaming* He was conductor of several important Eastern choral societies, and his compositions, particularly for the Church, are very widely known Other important compositions are *Song of Thanksgiving*, arranged for chorus and orchestra, a cantata, *The Rose* (1887), the *Ode to the Sun*, two symphonies in D and C, and some chamber music

GILDAS, gil'das, or **GILDUS**, gil'dūs (?-570) A British historian, known as St Gildas the Wise According to Mommsen, he was born at the end of the fifth or at the beginning of the sixth century, certainly before 504 He spent the last years of his life in Brittany His *De Excidio et Conquestu Britanniae* was first printed in London in 1525 and has been often reprinted, both in England and on the Continent This work derives its value mainly from the lack of other sources for the period Gibbon has described Gildas in a single sentence "A monk who, in the profound ignorance of human life, has presumed to exercise the office of historian, strangely disfigures the state of Britain at the time of its separation from the Western Empire" His narrative extends from the invasion of Britain by the Romans to the author's own time The best edition of Gildas's work is by Mommsen, in the *Monumenta Germaniae Historica, Auctores Antiquissimi*, vol xii (Berlin, 1898) The introduction is excellent For other editions and for secondary works, consult Moliner, *Les sources de l'histoire de France*, vol 1 (Paris, 1902) See NENNIUS

GILDED AGE, THE A story by Mark Twain and Charles Dudley Warner (1873), satirizing politics and society It introduces the typical character of Col Mulberry Sellers

GILDEMEISTER, gil'de-mi'stēr, JOHANN (1812-90) A German Orientalist, born at Klein-Siemen (Mecklenburg) He studied at Göttingen and Bonn, in 1839 he became lecturer in Oriental languages and literatures at Bonn, and in 1844 professor there From 1845 to 1859 he was at Marburg as professor of theology and Oriental literature and in the latter year accepted the chair of Oriental languages at Bonn His publications include *Sexti Sententiae* (1874), *Esdae Liber Quartus Arabice* (1877), *Idrisi Palästina et Syria Arabica* (1885), and an edition of the *Meghaduta and Srugaratilaka* (1840) of Kalidasa He was one of the founders of the German Oriental Society

GILDEMEISTER, OTTO (1823-1902) A German journalist and translator, born in Bremen From 1850 to about the time of his death he was editor in chief of the *Weser-Zeitung* of Bremen He is known for his German renderings of Byron's complete works (1864-65, 5th ed, 1904), of a number of plays of Shakespeare, including the historical ones, for the Bodenstedt edition, of Shakespeare's *Sonnets* (1871), Ariosto's *Orlando Furioso* (4 vols, 1882), Dante's *Divina Commedia* (1888, 3d ed, 1900).

GILDER, gîl'dēr, JEANNETTE LEONARD (1849–1916). An American journalist and critic, born at Flushing, N Y. She was connected from 1869 with various newspapers in Newark and New York, was associated with her brother, Richard Watson Gilder, in the editorship of *Scribner's Monthly*, now the *Century*, and was joint editor with her brother, Joseph B. Gilder, of the *Critic* from 1881 to 1906, when that magazine ceased publication, and she became associated with *Putnam's Magazine*, a periodical taking the name of its predecessor of an earlier generation, of which during its short life Joseph B. Gilder was editor. Her publications include *Representative Poems by Living Persons* (1886), *Pen Portraits of Literary Women* (1887), *Essays from the Critic* (1882), *Authors at Home* (1889), *The Autobiography of a Tomboy* (1900), *The Tomboy at Work* (1904). In 1909 she began to edit *The Reader*, a guide for book buyers, of which she was the proprietor.

GILDER, JOSEPH BENSON (1858–) An American editor, brother of Richard Watson and Jeannette L. Gilder (qqv). He was born at Flushing, N Y, studied two years in the United States Naval Academy, and for some time was engaged in newspaper work in Newark, N J, and New York City. In 1881, with his sister, he founded *The Critic*, later *Putnam's Magazine*, of which he was coeditor for many years. He was literary adviser to the Century Company (1895–1902), helped organize the University Settlement Society of New York, in 1902–04 was United States dispatch agent at London, and in 1910–11 was editor of the *New York Times* "Review of Books." He edited James Russell Lowell's *Impressions of Spain* (1899), Andrew Carnegie's *Gospel of Wealth* (1900), *The American Idea* (1902), *Addresses of John Hay* (1906), and with his sister, *Essays from the Critic* (1882) and *Authors at Home* (1889).

GILDER, RICHARD WATSON (1844–1909) An American poet and editor. He was born in Bordentown, N J, Feb. 8, 1844, the son of the Rev. William Henry Gilder, at whose seminary in Flushing, L I, he was educated. During the Civil War, while a student of law in Philadelphia, he served as a private in Landis's Battery at the time of the invasion of Pennsylvania. After some experience in editorial work here, with Newton Crane, founded the *Newark Register* and later was editor of *Hours at Home* and afterward assistant editor of *Scribner's Monthly*, into which the former was merged. In 1881 he succeeded Dr. Holland as editor in chief of the latter under its new name of the *Century*, a position which he held up to the time of his death. Mr. Gilder took an active interest in all public affairs, especially those which tend towards reform and good government, and was a member of many New York clubs. He was one of the founders of the Society of American Artists, of the Authors' Club, and of the International Copyright League, also chairman of the New York Tenement House Commission of 1894. He was first president of the New York Kindergarten Association, vice president and acting president of the City Club of New York; president of the Public Art League of the United States, a member of council of the National Civil Service Reform League, a founder of the Anti-Spoils League, and a member of the American Institute of Arts and Letters. His work includes *The New Day* (1875), *The Celestial Passion*, *Lyrics*, *Two Worlds*, *The Great*

Remembrance (these in one volume), *Five Books of Song* (1894), *For the Country* (a selection, 1897), *In Palestine*, and *Other Poems* (1898), *Poems and Inscriptions* (1901), *In the Heights* (1905), and, a collection, *A Book of Music* (1906).

GILDER, WILLIAM HENRY (1838–1900) An American Aëtic explorer, born in Philadelphia, Pa. At the beginning of the Civil War he enlisted in the Fifth New York Infantry (Dur yea's Zouaves), was transferred to the Fortieth, and was mustered out with the rank of captain and brevet major. In 1871–77 he was managing editor of the *Newark Register* and in 1878–80 was second in command on the expedition of Lieutenant Schwatka in search of the relics of Sir John Franklin. He accompanied the De Long expedition on the *Rodgers* under Captain Beriy and, after the burning of the vessel on the western shore of Bering Strait, made a mid-winter journey of nearly 2000 miles across Siberia to telegraph to the government the news of the disaster. He afterward participated in the search for De Long in the Lena Delta. In 1883 he was in Tongking as a war correspondent during the French-Anamese War and in 1884 visited the region of the earthquakes in Spain. On his expeditions and travels he was a correspondent of the *New York Herald*. He published *Schwatka's Search Sledging in the Arctic in Quest of the Franklin Records* (1881) and *Ice-Pack and Tundra* (1883).

GILDEROY, gîl'dēr-oi The romantic hero of a ballad preserved in Percy's *Reliques*, and a veritable character, Patrick of the Clan Gregor, in the annals of Perthshire, who was hanged as a highwayman, with five of his companions, in 1638. It was his boast that he had picked Cardinal Richelieu's pocket, robbed Cromwell, and hanged a judge.

GILDERSLEEVE, gîl'dēr-slēv, BASIL LANNEAU (1831–1924) A distinguished American classical scholar, born at Charleston, S C. He graduated from Princeton in 1849 and then studied in Germany at the universities of Berlin, Bonn, and Göttingen, receiving the degree of Ph.D. from Göttingen in 1853. Upon his return to the United States he was professor of Greek in the University of Virginia from 1856 to 1876, he was also professor of Latin in 1861–66. In 1876 he became professor of Greek at Johns Hopkins University, then newly founded. He undertook, in addition, the editorship of the *American Journal of Philology*, upon its establishment in 1880, and by his own writings in this journal and in the *Transactions of the American Philological Association*, as well as in his edition of Justin Martyr (New York, 1877), he made most valuable contributions to the syntax of Greek and Latin and to the history of Greek literature. On his seventieth birthday 44 of his former pupils, most of them professors in American universities, published in his honor a collection of their papers, entitled *Studies in Honor of Basil L. Gildersleeve*, an octavo volume of more than 500 pages (Baltimore, 1902). He published numerous works: *A Latin Grammar* (1867, 1894, 1899), a valuable edition of Persius (1875), an edition of Pindar, famous for its introduction (1885), *Essays and Studies Educational and Literary* (1890), *Hellas and Hesperia* (1909). Of very great importance is his *Syntax of Classical Greek from Homer to Demosthenes*, in collaboration with C. W. E. Müller (New York, part 1,

1900, part II, 1911) He was elected president of the American Philological Association in 1877 and again in 1908 and became a member of the American Academy of Arts and Letters as well as of various foreign learned societies. He received the degree of LL.D. from William and Mary (1869), Harvard (1896), Yale (1901), Chicago (1901), and Pennsylvania (1911), D.C.L. from the University of the South (1884), L.H.D. from Yale (1891) and Princeton (1899), Litt.D. from Oxford and Cambridge (1905).

GILDERSLEEVE, VIRGINIA CROCHERON (1877-) An American educator. She was born in New York City, attended the Brearley (preparatory) School, graduated from Barnard College (Columbia University) in 1899, and obtained her doctor's degree in 1908. She was assistant in English (1900-03), tutor (1903-05), instructor (1905-07), lecturer (1908-10), assistant professor (1910-11), and professor of English and dean (after 1911) of Barnard College. She became a member of various learned societies. She is author of *Government Regulation of the Elizabethan Drama* (1908).

GILDER'S WHITE See CHALK

GILDING (from *gild*, AS *gildan*, from *gold*) The art of covering a surface with a thin layer of gold. There are many processes of gilding, varying with the nature of the substance to be gilded and the kind of effect desired. The different methods, however, may be grouped under the three general classes of mechanical gilding, chemical gilding, and encaustic gilding.

Mechanical Gilding consists of applying gold leaf directly to a surface which has been previously prepared by the application of a size. The gold leaf, being placed on the size while it is only partially dry, adheres. Various forms of gold leaf, and various substitutes as well, are used for gilding. There is the genuine deep or reddish gold, pale gold, the paleness being due to a silver alloy, silver leaf, afterward colored or varnished to imitate gold, and "Dutch" leaf, a copper alloy having an appearance similar to gold. The gilding material is sold in "books," a gold book usually containing 24 leaves, 3 inches square. Several different sizes are also used, of which the commonest are "old gold size," a mixture of litharge, linseed oil, and ochre, and "water size," made by dissolving isinglass in boiling water, and adding an equal volume of spirits, and then straining the mixture through silk. Gilding may be applied in this manner to wood, cardboard or paper, textiles, metals, masonry, or ivory. When applied to cards, papers, or textiles, the surface must be rendered nonabsorbent by a preliminary sizing of weak glue before the regular gilding size is applied. Before gilding a metal surface it must be painted, to protect the surface from oxidation and decay. Metals, however, are rarely gilded by the mechanical process. Masonry, before being gilded, must be "satisfied"—i.e., its porous surface must be rendered waterproof by a solution of shellac and gutta-percha, in naphtha or some other equally efficacious coating. In gilding ivory a warm size is applied. Plaster of Paris needs several preliminary coats of boiled linseed oil before the gold size is applied. The object of the preparatory treatment of all surfaces is, of course, to secure a smooth, impenetrable, and permanent surface on which to lay the gold leaf. The leaf is accurately cut the de-

sired shape and applied to the sized surface by means of special tools. After being carefully brushed, to remove stray fragments, the gilding is given a final coat of specially prepared varnish. Glass is gilded by a special process. The gold sheet is made to adhere to the back of the glass simply by moistening it with the breath, the glass having been previously cleaned by a preparation of whiting, rubbed off with silk. The pattern is marked in reverse on the back, and that part of the gold inclosed in the pattern fixed by a coat of Brunswick black or other size. After this has thoroughly dried, the portions not included in the pattern are carefully rubbed off with wet cotton. Where gilt ornaments are to be put on a japanned ground, they are by one method painted with gold size, and gold leaf afterward applied. By another way rather more than the space the ornament is to occupy is wholly covered with gold leaf, adhering with isinglass. The ornament is then painted on with asphaltum, which protects the gold beneath it while the superfluous leaf is being washed away. A little turpentine will then remove the protecting asphaltum so as to display the gilt ornament.

GILDUS. See GILDAS

GILEAD, gîl'ad (Heb *Gîl'ad*, connected with Ar *jal'ad*, hard, rough) A mountainous district on the east side of the Jordan, whose boundaries are variously conceived in different portions of the Old Testament. In general, it includes the whole mountain region between the Yarmuk on the north and the Arnon on the south, the eastern boundaries being formed by the desert table lands of Arabia (the plains of Bashan), and the western by the Jordan. In spite of its name, Gilead is a beautiful and fruitful region. The vegetation is luxuriant, especially in the central part round the brook Jab-bok, where forests of oak and terebinth occur. Gilead, in fact, is better provided with water and woodland than any part of western Palestine. It formerly produced gums and spices. The hills are not very high, and they have broad summits almost like table lands. The district is well adapted for pasturage (Num xxxii 1). Gilead was much exposed to Bedouin raids from the east and other hostile attacks, and its history has much to do with wars. The land was conquered from Sihon and Og and handed over to Reuben, Gad, and the half tribe of Manasseh (Num xxi 21-26, Deut iii 16). These tribes held it against the Midianites (Judg viii), Ammonites (Judg xi 32, xii 3), and Syrians (2 Kings ix 14), but finally lost it to the Assyrians. Tiglath-pileser captured the land and carried the inhabitants captives (1 Chron v 26). Gilead is also interesting as forming a refuge to which Absalom fled (2 Sam xiii 38) when fearing the anger of his father, while subsequently, during the rebellion of Absalom, David found an asylum there (2 Sam xvii 27-29). It was in Gilead, likewise, that Ishbosheth, the son of Saul, was proclaimed King by Abner (2 Sam. ii 8-9). The valiant men of Jabesh-Gilead performed the last rites for the bodies of Saul and his sons after the battle of Mount Gilboa (1 Sam. xxxi 11-13). Elijah sojourned there (1 Kings xvii 1), and Jesus made visits to this region. In the wars of the Maccabees Gilead played an important part, and under Roman occupation its natural resources were greatly developed. Among the principal cities were Mahanaim, Succoth, Penuel, Mizpeh, and

Jazer, in latter times Pella and Gerasa. A conspicuous mountain (perhaps the Jebel Osha) was known as the mountain of Gilead (Gen xxxi 21 et seq). Consult Oliphant, *The Land of Gilead* (London, 1880), and Merrill *East of the Jordan* (New York, 1881).

GILES, JILZ, HENRY (1809-82) An Irish-American clergyman, lecturer, and essayist. He was born in County Wexford, Ireland, and was educated in the Roman Catholic faith at the Royal Academy at Belfast, but he afterward joined the Unitarian church and held pastorates at Greenock and Liverpool. In 1840 he came to the United States, where he soon became known as a lecturer and essayist of considerable force and originality. He published *Lectures and Essays* (1845), *Christian Thought on Life* (1850), *Illustrations of Genus in Some of its Relations to Society and Culture* (1854), *Human Life in Shakespeare* (1868, revised, 1887), *Letters and Essays on Irish and Other Subjects* (1869).

GILES, HERBERT ALLEN (1845-) An English Orientalist, educated at the Charterhouse. He entered the China consular service in 1867, was Vice Consul at Pagoda Island (1880-83) and Shanghai (1883-85) and Consul at Tamsui (1885-91) and Ningpo (1891-93), and was professor of Chinese at Cambridge and (in 1902) first lecturer at Columbia University on the Lung Foundation. Among his writings were *Chinese without a Teacher* (1872, 6th ed, 1908), *Chinese Sketches* (1876), *Handbook of the Swatow Dialect* (1877), *Glossary of Reference* (1878, 3d ed, 1900), *Historic China* (1882), *The Remains of Lao Tzu* (1886), *Chinese-English Dictionary* (1892, 2d ed, 1912) and *Chinese Biographical Dictionary* (1897), which received the Prix St Julien of the French Academy, *Chinese Poetry in English Verse* (1898), *History of Chinese Literature* (1901), *China and the Chinese* (1902), *Introduction to the History of Chinese Art* (1905), *Chinese Fairy Tales* (1911), *The Civilization of China* (1911), *Adversaria Sinica* (1906-13), *China and the Manchus* (1912).

GILES, PETER (c 1860-) An English philologist, educated at Aberdeen University, at Gonville and Caius College, Cambridge, and at Freiburg. At Cambridge he became fellow of Gonville and Caius in 1887, fellow and classical lecturer of Emmanuel in 1890, university reader in comparative philology in 1891, and master of Emmanuel in 1911. He published an excellent *Short Manual of Comparative Philology* (1895), and wrote, especially on Greek linguistics, for philological journals, etc.

GILES, JILZ, SAINT (Gk *Atyðios*, *Atyðios*, Lat *Ægidius*) A hermit of France and abbot of a Benedictine monastery in the second half of the seventh century. He is said to have been an Athenian of royal descent, from early years distinguished for piety and charity. Annoyed by the publicity to which his reputation as a holy man exposed him at home, he went to Provence about 665 and took up the hermit life in a solitary spot near the mouth of the Rhône, living upon herbs and the milk of a hind which came to his cell at stated hours. Here he was discovered by the King of the Goths, who while hunting followed the hind to the hermit's cave. Reluctantly *Ægidius* consented that a monastery should be established at the place. He became its first abbot and held the office till his death. Consult Rembry, *Saint Gilles* (Bruges, 1881).

GILES, WILLIAM BRANCH (1762-1830) An American politician and legislator. He was born in Amelia Co., Va., was educated at Hampden-Sidney and Princeton (1781), studied law with Chancellor George Wythe, and practiced law for several years in Petersburg, Va. In early life he was a Federalist in politics, but association with Jefferson's followers in his native State caused him to change his views, and he was elected to Congress in 1790 as a Republican. During his career in the House, which lasted until 1803, with the exception of the session of 1799-1801, he was leader of the extreme Republicans, with Edward Livingstone, Nathaniel Macon, Andrew Jackson, and a few others, he voted against the adoption, after Washington's last message, of a complimentary vote approving his policies. In 1791 he actively opposed the proposition for the establishment of the United States Bank. In January, 1793, he accused Hamilton, then Secretary of the Treasury, of corruption, and when Hamilton vindicated his acts, Giles pressed resolutions of censure, which the House refused to adopt. In 1795 he led the opposition to the Jay Treaty (q.v.). In 1798 he was an earnest advocate of the principles of the Virginia Resolutions, joining with Madison, Taylor, and Wilson Cary Nicholas in securing their adoption. From 1799 to 1801 he served in the Legislature of Virginia. He used the most bitter invectives in his debates, declared that the nation was being undermined by monarchical tendencies, and openly charged the Federalist leaders with being in the pay of Great Britain. The Federalists detested him thoroughly. He succeeded Wilson Cary Nicholas in the United States Senate in 1804 and became at once the leading spokesman of his party. He was one of the leaders in the impeachment of Justice Chase (see CHASE, SAMUEL), but voted for his acquittal on a majority of the charges, causing a breach which was never healed between himself and John Randolph, the principal manager of the impeachment trial on the part of the House. On the collapse of the Burr conspiracy in 1807, Giles introduced a bill for the suspension of the writ of habeas corpus, and secured its passage in the Senate, but it was defeated, through the influence of Randolph, in the House. Another bill introduced by him, which defined treason and provided severe penalties, was superseded in the House by a milder bill of Randolph's. In December, 1808, he introduced his bill for the strict enforcement of the embargo, which was intended by the severity of its provisions to break down the embargo entirely. From 1809 to 1815 Giles was active in the factional fights within his party, and, with Samuel Smith and Vice President George Clinton, formed the cabal that eventually drove Gallatin from the cabinet, hampered the Madison administration by forcing upon it Robert Smith as Secretary of State, and by opposing its war policy and aiding the Federalists almost disrupted the Union itself. Nevertheless, he was made chairman of the Senate Committee on Foreign Relations in 1811, in which position he was able to force upon Madison several military measures. Being absolutely discredited as a party leader and distrusted by his colleagues, he resigned his seat in the Senate in 1815. He lived in retirement until 1825, when he was an unsuccessful candidate for the Senate against John Randolph. In 1827 he became Governor of Virginia, and

office which he held until shortly before his death

GILES LAND See GILLIS LAND

GILFIL, gil'fil, REV MAYNARD The hero of George Eliot's *Mr Gilfil's Love-Story*

GILFILLAN, gil-fil'an, GEORGE (1813-78) A Scottish critic and essayist. He was born at Comrie, a village in Perthshire, Jan 30, 1813. Educated at the University of Glasgow and at the Divinity Hall of the Secession Body (afterward the United Presbyterian church), he was ordained, in 1836, to the School Wynd Church, Dundee, where he remained till his death, Aug 13, 1878. His works, in which he displayed wide literary sympathies, are numerous. Among them are *A Gallery of Literary Portraits* (3 series, 1845, 1850, 1854), *The Bards of the Bible* (1850), *The Martyrs of the Covenant* (1852), *History of a Man*, in part autobiographical (1851), *Night A Poem* (1867), lives of Scott (1870) and of Burns (1879), and an edition of the *British Poets* (1853-60). He did much to promote popular education and was a successful lecturer. His *Literary Portraits* were reprinted in 1909.

GILGAL, gil'gäl (Heb, circle, referring to the circle of stones marking a sacred spot.) The name of an ancient city in the Jordan valley between Jericho and the river. According to Josh. iv, it was here that the Israelites first encamped after crossing the Jordan, and this place is represented as their headquarters during the war for possession of Canaan. Here the 12 stones from the Jordan are said to have been erected, and all Israel was circumcised in this sacred spot. It occurs frequently in the history of Samuel and Saul. Its importance as a sanctuary is evident from the fact that Saul was made King of Israel there, and that it is often mentioned by Hosea, Amos, and Micah. It is doubtful whether the same Gilgal is meant in the story of Elijah and Elisha (2 Kings ii 1, iv. 38), the name is of such a character that it may well be supposed that many places were thus designated, but no convincing evidence has been produced to show that the Gilgal of the Jordan valley is not intended. In Josh xii. 23 the original reading does not seem to have been Gilgal, but Gahil as the Greek version indicates. Gilgal is represented to-day by a mound called Tell Jeljul, near Jericho. Consult Guthe, in *Bibeluorterbuch* (Tubingen, 1903).

GILGAMESH, gil'ga-mesh The name of the hero in a Babylonian epic, large portions of which have now been found among the cuneiform tablets constituting the "brick" library of King Asurbanipal. At first the name of the hero, written ideographically, was provisionally read *Izdubar* (or *Gishdubar*), which simply represented the sound of the three signs *iz* (or *gish*), *du*, and *bar*, with which the name was written. The phonetic reading "Gilgamesh" was discovered by T. G. Pinches in 1890. The Gilgamesh epic consisted originally of 12 tablets and comprised about 3000 lines. About half of it has been recovered. The epic is a composite production, many of the stories told about Gilgamesh being attached to him merely because he became the favorite hero of the Babylonians, whose adventures acquired great popularity. In the Gilgamesh epic dimmed historical traditions and pure myth are represented in about equal proportions. He is a defied hero. As a hero, he is primarily associated with the South Babylonian city Uruk (modern Warka), which he

conquers, as a god, he is a solar deity who is introduced in incantations and hymns. Gilgamesh is a hero of irresistible strength and among his adventures is a fight against a tyrant, Khumbaba, who is represented as dwelling in a fortress situated in a grove of wonderful grandeur. This adventure probably recalls some historical event, but in the sixth tablet a mythical element is introduced. Ishtar, the goddess of fertility, has become enamored of Gilgamesh and offers herself to the hero, who, however, refuses her and adds insult to injury by reprimanding the goddess for her cruelty to her former lovers. As a punishment, a mighty bull is sent out by Anu, the god of heaven, to kill Gilgamesh, but the latter successfully vanquishes the bull. Thereupon Gilgamesh is smitten with disease and begins a long series of wanderings in search of healing. This disease represents the decline of the year, when the sun (Gilgamesh), removing itself from the earth (Ishtar), is imagined to be deprived of its former strength. Associated with Gilgamesh is another hero, Engidu, of whom, likewise, stories were current, some of which were transferred to Gilgamesh. Engidu and Gilgamesh become associates, and the former is also punished by Ishtar and eventually dies, whereas Gilgamesh ultimately finds a remedy that at least partially restores him. In the course of his wanderings he has many adventures. He passes through dangerous regions, encounters scorpion men and lions before he reaches an ancestor, Ut-napish-tim, who has survived a destructive deluge, and from whom Gilgamesh hopes to learn the secret of eternal life and also to obtain healing from disease. When he at last encounters Ut-napish-tim, the latter tells him the story of the deluge (qv), and while Gilgamesh does not learn the secret of immortality, he is healed of his disease and returns to Uruk.

It was formerly supposed that Gilgamesh was the counterpart of the biblical Nimrod, but this theory has now been abandoned. Gilgamesh bears a certain relationship to Samson, and phases of the Gilgamesh epic are thought by Jensen and others to have passed on to the Greeks and to have been embodied in the Hercules epic. Again, in the legends which cluster in the Orient around Alexander the Great, certain elements have been introduced which can be traced back ultimately to the Babylonian tales of Gilgamesh. Consult Haupt, *Das babylonische Nimrodepos* (Leipzig, 1884-92), *Jeremias, Izdubar-Nimrod* (ib, 1891), Jensen, *Keilinschriftliche Bibliothek*, vi, 1 (Berlin, 1900), id, *Das Gilgameschepos* (Leipzig, 1906), Ungnad, in Gressmann, *Altorientalische Texte und Bilder* (Tubingen, 1909), Rogers, *Cuneiform Parallels to the Old Testament* (New York, 1912), Jastrow, *Religion Babylonians und Assyriens* (Tubingen, 1902-12), id, *Babylonian and Hebrew Traditions* (New York, 1914).

GILIA (Neo-Lat, named in honor of Felipe Gil, a Spanish botanist). A genus of about 70 species of annual or biennial and a few perennial herbs (mostly western) of the family Polemoniaceæ. The species have small, many-colored, funnel-shaped or bell-shaped or sometimes salver-shaped five-lobed corollas, and some of the species have become popular in gardens, for which purpose they are well adapted, since they are hardy, prolific of bloom, sturdy, and of simplest culture. The seed is sown in any good soil, usually where the plants are to remain.

Gila tricolor is shown on Plate of CALIFORNIA FLORA

GILIAKS, gil'i-aks A people of the northern portion of the island of Saghalien, and the coast and lowlands about the mouth of the Amur and Liman. They number some 4500 and are divided into three tribes, with at least two chief dialects. Physically they seem to be a mixed people—one type found among them resembling more the Aino, the other the Tungus, but generally they are brachycephalic, of average height, and well built. Their marriage regulations and their bear festivals are of great interest. The Giliaks, who are a hunting and fishing folk, have been influenced in their house-building and domestic arrangements by the Russians and in the ornamentation by the Chinese. Brin-ton (1890) classes them with the Tchukchis, Koriaks, Kamchatkans, etc., but Steinberg, who lived several years in this part of Asia, and Laufer incline to place them as a people apart from all others, in respect of language in particular. Some include them in the so-called "Paleo-Asiatics." The Giliaks possess a canoe of the monitor form, which resembles that of the Kootenay Indians of British Columbia. The Amur and the Kootenay rivers are the only regions of the globe where this type is found. Besides the article of Deniker on the Giliaks in the *Revue d'Ethnographie* (Paris), for 1884, the literature about them embraces Schrenck, "Die Völker des Amurlandes," vol. III of his *Reisen und Forschungen in Amurland, 1854-56* (St. Petersburg, 1881-91), Laufer, "Explorations among the Amoor Tribes," in *American Anthropologist* (New York, 1900), and the researches of Sternberg, continued by Weinstein in the *Verhandlungen der Berliner Gesellschaft für Anthropologie* for 1901.

GILIMER. See GELIMER.

GILL, gil, or **BRANCHIA**, brän'ki-a (from Dan *gælle*, gill, Icel *göllnar*, gills; connected with Icel *gul*, Eng *gill*, ravine). One of the special respiratory paired organs of animals which breathe oxygen dissolved in water. The lowest animals respire directly through the thin body wall at all parts of the surface and consequently require no special respiratory organs. In the higher animals, such as the mollusks, the body has become of great size and has a thick skin for protection, and the skin is often covered by a secreted cuticula or a shell. Under these circumstances oxygen cannot be taken in at all parts of the body, and there must be special organs for respiration, the essential feature of which is that they shall have a delicate, permeable wall. The gills are such organs. The gills are, almost without exception, outgrowths of the body wall, provided with a thin wall and bathed by water. They contain blood spaces, or blood vessels, which carry the oxygen from the gills to the tissues and probably carry carbonic acid back to the gills to be excreted there. All gills, therefore, are physiologically alike, but they are not all homologous. We cannot consequently describe them all from one point of view, but shall have to consider them by classes. Gills have arisen independently in at least four different phyla, and even inside a single phylum the gills are by no means all related. We shall consider in order the gills of worms, mollusks, echinoderms, annelids, arthropods, and chordates.

Worms, Brachiopods, etc. The flatworms, roundworms, and rotifers respire over the

whole surface of the body, but in the Polyzoa and Brachiopoda, in which the body is more or less incased in a shell, the tentacles, taken together, form a respiratory organ and may be spoken of collectively as gills. The tentacles are thin-walled and hollow, and their cavities communicate with the general body cavity, so that the body lymph may carry oxygen from the gills to the tissues.

Mollusks These massive animals have to solve a much harder problem in respiration than have the Scolecida. In the lamellibranchiate the foot is surrounded by a double row of tentacles. These remain as distinct straight filaments in a few genera, such as *Nucula*, *Leda*, *Yoldia*, and *Solenomya*, but each filament is reflected, making a knee bend, so that each series of filaments, or "gills," is double, as in *Anomia*, *Arica*, and the mussels (*Mytilidae*). The reflected part of each filament may be united with the basal part, and the free end of the reflected filament may grow fast to the body or to the mantle. In the other lamellibranchs the adjacent filaments are united by crossbars, forming a sort of network. Each filament and connecting bar is hollow. Blood courses through it and receives oxygen from the water that rushes by it on all sides. The mechanism for bringing the water to the gills is simple—water rushes into the mantle chamber, bathing the gills and penetrating between the filaments as it goes in and out. In the shelled gastropods there is a pair of gills on the right and left of the neck in a few symmetrical species, but in most of the spirally coiled species there is only one gill, and that is on the left side. The gill consists of a finger-like process containing a vessel carrying blood to the tip of the gill and one carrying it from the gill. In passing from the first to the second vessel the blood is spread out over numerous thin-walled plates, where it comes in contact with the water. In the naked gastropods respiration occurs chiefly on the whole surface of the body, but sometimes by special finger-like outgrowths. In cephalopods there are either two or four gills, which lie in the mantle cavity, projecting forward, and are fastened on both sides. The general arrangement is the same as in the gastropod gill, but the capillary absorbing surfaces are much increased in area.

Echinoderms The respiratory organs in the group of echinoderms are not all homologous, for the most part they have the function, as it were, by accident. In the starfishes parts of the outer skin are raised up to form thin-walled papillæ, which are believed to be respiratory. In the serpent stars the thin-walled pouches lying next the arms in which the sexual products are thrown serve also for respiration. In the sea urchins there is a gill at the base of each interradius on the outer edge of the thin membrane about the mouth. The gill is merely a thin-walled sac of the skin, into which the body fluids can flow. In the sea cucumbers (*Holothuroidea*) there are special, complicated respiratory organs called the respiratory trees. They arise from the lower end of the food canal, as great branched sacs extending up into the body cavity. Water flows into these "trees" and out of them at regular intervals. The "trees" are wanting in a few thin-walled sea cucumbers, such as *Synapta* and a pelagic and a deep-sea form.

Annelids and Arthropods. The thick-skinned fresh-water annelids need no gills, but

the thick-skinned marine ones have usually some special provision for respiration. The swimming feet often have a thin, broad lobe containing blood vessels, and in a few annelids there are special filiform or branched outgrowths of the feet, which aid in respiration. Since the Crustacea are thick-skinned, nearly all of them have gills. In the Lower Crustacea there are respiratory plates (podobranchia) attached to the legs, but in the higher forms these leg organs form pyramidal masses with central efferent and afferent vessels leading to and from the hundreds of delicate papillae of which the gill is composed. The gills are so placed that the blood leaving them goes directly to the heart. The great gills are covered by a special shield, the carapace.

In the merostomes (king crabs, etc.), the gills are broad, flat, and rounded sacs, like the leaves of a book, forming a file of upward of 100 on each of the gill-bearing abdominal legs. In the trilobites the gills form triangular expansions of certain of the segments of many of the legs behind the head.

Insects The gills of insects whose nymphs or larvae are aquatic are called "tracheal" gills, because they are permeated by fine air tubes, they are long or flattened leaflike filaments attached to the sides or end of the body. Such are the gills of the larvae of the caddis flies, and of certain aquatic caterpillars (*Paraponyx*), those of the nymphs of May flies are broad and leaflike. In the highly modified nymphs of certain May flies (*Bænsca* and *Protopistoma*), the dense masses of tracheal gills are entirely concealed and protected by projections of the mesothoracic segment, so as to form a true respiratory chamber, to which the water gains access by minute openings. Blood gills are described by Fritz Muller as certain delicate and tubular processes, into which the blood flows, and which do not contain tracheæ. Muller compares them with the gills of Crustacea, they occur in case worms. The larva of *Pelotrus*, a beetle, has true blood gills. A few adult insects (*Pteronarcys*, and other Perlidae) have tracheal gills arising in tufts on the underside of the thorax. In a dragon fly (*Euphaea*) the gills of the nymph are retained in the imago. The nymphs of many dragon flies breathe by rectal gills. Consult Packard, *Text-Book of Entomology* (New York, 1898).

Chordata Gills in this group are at least roughly homologous. In all the lower aquatic forms water is taken into the mouth and forced out through slits in the neck. The sides of these slits, when the current is strongest, are beset with filaments in which the blood circulates and receives oxygen. The gills may be covered, as in most fishes, or they may stand out from the sides of the body, as is the case in gilled Amphibia. The latter position is a precarious one, for the gills are often bitten off, but they can be quickly regenerated. See ALIMENTARY SYSTEM, EVOLUTION OF THE; RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF THE.

Fishes The lampreys, myxinoidea, sharks, and rays are termed fishes with "fixed gills," because in them each supporting septum of the anterior and posterior branchial mucous surfaces is attached to the pharyngeal and dermal integument by its entire outer margin, and the streams of water flow out by the same number of fissures in the skin as those by which they enter from the pharynx. In the osseous and in

the ganoid fishes there are "free gills," the outer border of the supporting branchial arch being unattached to the skin and playing freely backward and forward, with its gill surfaces, in a common gill cavity, which has a single outlet, usually in the form of a vertical fissure. In the

ARRANGEMENT OF A FISH'S GILLS

Fig 1 Diagram to show the arrangement of the gills in a bony fish, as seen in a horizontal section of the branchial chamber on one side. *gc*, gill cover, *gs*, gill slit, *ba*, common branchial chamber, *ba 1* to *ba 4* first four gill-bearing branchial arches, the first three having a double series of branchial laminae, the fourth having only a single series, *ba 5*, rudimentary fifth branchial arch ("inferior pharyngeal bone"), which carries no gills, *op*, pseudobranchia or "opercular gill," developed on the inner face of the gill cover. The arrows show the passage of the water through the branchial fissures and out by the gill slit. Fig 2 Diagram of a pair of branchial laminae in a bony fish. *e*, branchial arch transversely divided, showing the external groove in which the great vessels run, *a*, branchial artery, giving off branches (*bb*) along the inner edges of the branchial laminae, *c*, branchial vein, receiving branches (*dd*) from the outer edges of the branchial laminae.

myxinoidea (see illustration under HAGFISH) six or seven branchial sacs open on each side, and their outlets are produced into short tubes, which open into a longitudinal canal, directed backward and discharging its contents by an orifice near the middle line of the ventral surface. Between the two outlets is a third larger one, which communicates by a short duct with the end of the oesophagus and admits the water, which passes from that tube by the lateral orifices leading into the branchial sacs. These sacs, which are developed from the oesophagus, and which may be regarded as the simplest form of piscine gill, have a highly vascular, but not a ciliated, mucous membrane, which is arranged in radiating primary and secondary folds, so as to increase the surface. In the lampreys there is a further separation of the respiratory from the digestive tract, for each internal blind duct communicates with a median canal beneath and distinct from the oesophagus.

In all the higher fishes the inlets to the branchial interspaces lie on each side of the gullet and are equal in number with the interspaces, while, except in the elasmobranchs, there is only one outlet on each side. These outlets vary extremely in size, being relatively largest in the herring and

GILLS OF A PERCH

Gills and heart of the perch, exposed by the removal of the gill cover on the left side. *a*, first of the four bony arches which carry the gills (*b br*), *br*, lower edges of the gills on the right side, *h*, heart.

mackerel families, and smallest in the eels and lophiid fishes, as the angler (qv). The length of time that different fishes can exist out of water depends on the modifications for retaining water in the branchial chambers. As a general rule, the chamber is largest where the outlet is smallest, as in the eels, blennies, and lophioids, and these are the fishes that survive the longest out of water, except in such cases as the climbing fish (qv), in which the branchial apparatus possesses complex labyrinthic appendages. The main object of the gills of fishes being to expose the venous blood, in very thin-walled vessels, to streams of water, the branchial arteries rapidly subdivide into capillaries, which constitute a network in one layer, supported by an elastic plate, and covered by a tessellated but nonciliated epithelium. This covering and the capillary wall are so thin as to admit free interchange to take place between the blood, loaded with carbonic acid, on the one hand, and the aerated water on the other. The extent of respiratory surface is increased in various ways, of which by far the most common is "by the production of the capillary-supporting plates from each side of long, compressed, slender, pointed processes, extending, like the teeth of a comb, but in a double row, from the convex side of each branchial arch." The number of vascular plates or lamellae attached to each branchial process has been estimated at 135 in the carp, 700 in the eel, 1000 in the cod, 1400 in the salmon, and 1600 in the sturgeon.

Amphibia. We now pass on to the consideration of these organs in amphibians. In the lower or perennibranchiate members of this order the gills exist permanently, but in the great majority they are mere temporary organs. In the newt three pairs of external gills are developed, at first as simple filaments, each with a capillary loop, but speedily expanding and giving off looplets. The gill is covered with ciliated epithelium, which loses the cilia before the absorption of the organ, and this takes place after a few days of larval existence. In the larval frog the gills, which are on a simpler plan, diminish about the fourth day and disappear on the seventh. The parts of the branchial framework which support the deciduous gills never get beyond the cartilaginous stage. They thus readily shrink and become more internal as the head increases in size. As the gills of the perennibranchiate amphibians in all essential points resemble those already described, it is unnecessary to notice them. See AMPHIBIA, DIPNOI.

GILL, zhel, ANDRÉ, pseudonym of LOUIS ALEXANDRE GOSSET DE GUINNES (1840-85). A French illustrator, born in Paris. His first work appeared in *La Lune* and afterward appeared in *L'Eclipse*. He excelled in the caricature of portraiture, and the best known of his drawings are the series of "Our Contemporaries" and "Our Deputies." He painted pictures that were shown at the Salon and wrote plays that were acted and verse that was often reprinted, but his great reputation was as a caricaturist of contemporary politics.

GILL, gil, AUGUSTUS HERMAN (1864-) An American industrial chemist. He was born at Canton, Mass., graduated from Massachusetts Institute of Technology in 1884, and received a Ph.D. from the University of Leipzig in 1890. At the former institution he was assistant in 1884-87, instructor in 1890-94, assistant professor of gas analysis from 1894 to 1906, associate

professor of technical analysis in 1906-09, and professor after 1909. He lectured at Wellesley College in 1892-93. He was president of the New England section of the American Chemical Society in 1903. He is author of *Gas and Fuel Analysis for Engineers* (1896, 7th ed., 1913), *A Short Handbook of Oil Analysis* (1895, 7th ed., 1913), *Engineering Chemistry* (1907, 2d ed., rev and enlarged, 1913).

GILL, gil, SIR DAVID (1843-1914). A Scottish astronomer, born in Aberdeenshire. He studied at the University of Aberdeen and in 1873-76 was director of the private observatory of the Earl of Crawford (then Lord Lindsay) at Dunecht (Aberdeenshire), in which capacity he organized the transit of Venus expedition sent by Lord Lindsay to Mauritius. In 1877 he organized and conducted an expedition to the Ascension island for the purpose of determining the solar parallax through observation of Mars. For the results of this expedition he was awarded the gold medal of the Royal Astronomical Society, and the Valz prize at the Académie des Sciences of the Institut de France. From 1879 to 1907 he was Royal Astronomer at the Cape of Good Hope. In 1882-83 he carried out, with Elkin, an investigation of remarkable accuracy into the parallaxes of nine of the chief southern stars and in 1887 he undertook a second and equally important series of parallax observations. In 1885-96 he executed the geodetic survey of Natal and Cape Colony and in 1897 organized the geodetic survey of Rhodesia. His success in photographing the great comet of 1882 led him to urge the desirability of the use of photography in the preparation of catalogues of the stars, and in 1885 he began the "Cape Photographic Durchmusterung," by which the survey of the heavens carried out by Argelander in his "Bonn Durchmusterung" was extended to the south pole. The publication of the results of this great survey of the southern heavens, which gives the positions of 454,875 stars, was completed in 1900. In that year he was made Watson gold medalist of the National Academy of Sciences, Washington, D.C. In 1903 he was awarded the royal medal of the Royal Society, and in 1908, for the second time, the gold medal of the Royal Astronomical Society. He was president of the British Association in 1907-08 and of the Institute of Marine Engineers in 1910-11. His writings include memoirs on "Helometer Determinations of Stellar Parallax in the Southern Hemisphere" and "A Determination of the Solar Parallax and Mass of the Moon from Helometer Observations of Victoria and Sappho" (in *Annals of the Cape Observatory*, vols vi and vii, 1896). He also wrote *A Determination of the Solar Parallax from Observations of Mars at the Island of Ascension* (in the *Memoirs of the Royal Astronomical Society*, 1b, vols xlii and xliiii, 1881 and 1885) and *History and Description of the Royal Observatory, Cape of Good Hope* (1913).

GILL, JOHN (1697-1771). A Baptist minister, distinguished for his knowledge of rabbinic literature. He was born at Kettering, Northamptonshire, Nov. 23, 1697. He spent a short time at Kettering Grammar School, and continued his studies in private. At an early age he began to preach, and was ordained in 1718. In 1719 he became pastor of a Baptist church at Horsleydown, in Southwark, in 1757 he removed to a new chapel in Camberwell, a London suburb, where he remained till his death,

Oct 14, 1771 Gill was a very voluminous author. His greatest work was his *Exposition of the Holy Scriptures* (New Testament, 1746-48, Old Testament, 1748-63). He also wrote a *Dissertation on the Antiquity of the Hebrew Language, Letters, Vowel Points, and Accents* (1767), and many controversial works of merely temporary interest. He was a strong Calvinist. Consult his memoir by Ripon (London, 1816).

GILL, THEODORE NICOLAS (1837-1914). An American zoologist, born in New York City. In 1865-67 he was librarian of the Smithsonian Institution, in 1866-75 assistant librarian of the Library of Congress, and in 1884 became professor of zoology in Columbian (now George Washington) University. He was elected a member of the National Academy of Sciences, was appointed an associate in zoology in the United States National Museum, and in 1896 served as president of the American Association for the Advancement of Science. His writings, chiefly on ichthyology, include *Synopsis of Fresh Water Fishes* (1861), *Arrangement of the Families of Mollusks* (1871), *Catalogue of the Fishes of the East Coast of North America* (1873, part 1 of the *Report for 1871-72* of the United States Commission of Fish and Fisheries), *Bibliography of the Fishes of the Pacific Coast of the United States to the End of 1879* (1882), *Principles of Zoogeography* (1884), *The Characteristics of the Family of Scatophagoid Fishes* (1891); *Notes on the Tetradontoidea* (1892), *Parental Care among Fresh-Water Fishes* (1906). He also prepared with Elliott Coues *Material for a Bibliography of North American Mammals* (1877, in vol xi of Hayden, *Report of the United States Geological Survey of the Territories*).

GILL, WILLIAM JOHN (1843-81). An English military engineer and traveler, born at Bangalore, India. He studied at Brighton College and the Royal Military Academy (Woolwich), in 1864 was commissioned a second lieutenant in the Royal Engineers, and in 1869-71 served in India. From 1871 to 1876 he was in England, on duty at Aldershot, Chatham, and Woolwich. In 1874 he contested Hackney, and in 1880 Nottingham, both successfully. His first experience as a traveler was had in 1873, when he accompanied Col Valentine Baker in a journey through Persia, during which he executed a survey contributing much to geography. In 1876 he was transferred to Hongkong, and in 1876-78 traveled in China and Tibet. This last journey is the one for which he is best known. For the results of this journey, comprised principally in a large map and in a memoir published in the *Journal of the Royal Geographical Society*, he obtained the gold medal of that society (1879) and that of the Paris Geographical Society (1880). In 1879 he was appointed assistant boundary commissioner on the boundary between Russia and Turkey, newly established by the Berlin Treaty. He was in Egypt in 1881 on special service, and having been sent to cut the telegraph wire which led from Cairo across the desert to Syria, was murdered by Bedouins at Wady Sahr. He published *The River of Golden Sand* (2 vols, 1880, new ed, 1883), a popular account of his journey in Tibet and China.

GILLE, zhél, PHILIPPE EMILE FRANÇOIS (1831-1901). A French dramatist. He was born in Paris and at first studied sculpture, but in 1861 he became secretary of the Lyric

Theatre. He was on the staff of several Parisian journals, notably the *Figaro*, for which he began in 1869 to write the bibliographical criticisms. Some of these have been collected under the title *La bataille littéraire* (4 vols, 1889-91). He also wrote a number of librettos and ballets and several comedies, such as *Vent du soir* (1857, music by Offenbach), *Le bœuf Apis* (1865, music by Delibes), *Les charbonniers* (1877), *Yedda*, a ballet (music by Métra), *Lakmé* (1883, for Delibes's music), *Manon*, the book of *Clarissa Harlowe* for Bizet, who died before completing the opera, and *Camille* (1890). He published a volume of poems, *L'herbier* (1887), and *Mémoires d'un journaliste* (5 vols, 1869-76). Gille married a daughter of the composer Massé.

GILLEM, gil'lem, ALVAN CULLEM (1830-75). An American soldier, born in Jackson Co, Tenn. In 1851 he graduated at the United States Military Academy, in 1851-52 served against the Seminole Indians, and during the Civil War was chief quartermaster of the Army of the Ohio in the Tennessee campaign, was appointed colonel of the Tenth Tennessee Volunteers in 1862, and from 1863 until the close of the war, with rank of brigadier general of volunteers, was active in Tennessee, where he was adjutant general, and where, in a campaign to protect the loyal mountaineers, he surprised and killed the Confederate General John H. Morgan (Greenville, Sept 4, 1864). For bravery at Marion, Va, he was brevetted lieutenant colonel and for general services colonel in the regular United States army. At the reorganization of the Tennessee State government towards the close of the war he was vice president of the convention (Jan. 9, 1865) for the revision of the constitution, and sat in the first Legislature elected thereafter. Brevetted major general and commissioned colonel, he was in command of the district (and subdistrict) of Mississippi in 1867-68, and was prominent in the operations against the Modoc Indians in 1873.

GILLE'NIA (Neo-Lat, named in honor of Arnold Gill, a German botanist). A genus of perennial plants of the family Rosaceae, natives of the temperate parts of eastern North America. The roots are used in medicine as a mild emetic, and in small doses as a tonic. There are two species which are often called Indian physic, *Gillenina trifoliata*, also known as American ipecac, Indian hippo, and dropwort, and *Gillenina stipulata*, or bowman's root. The plants of this genus grow to a height of about 2 feet, and on account of their graceful foliage are often planted in shrubberies.

GILLESPIE, gil-lés'pi, ELIZA MARIA (known also by her religious name, "Mother Mary of St Angela") (1824-87). She was a cousin of Thomas Ewing (qv). After a conventual education at Somerset, Ohio, and Georgetown, D C, she entered the Congregation of the Holy Cross (1853), and in 1855 became mother superior of the Academy of St Mary, then at Bertrand, Mich, afterward removed by her to St Mary's, near Notre Dame, Ind. At the beginning of the Civil War she organized among the sisters a board of hospital nurses, which, with the centre of work at Cairo, Ill, rendered effective service in the care of wounded and sick. Upon the separation of her order in the United States from the European body in 1869, she became mother superior. Consult the *In Memoriam, Mother Mary* (Notre Dame, Ind, 1887).

GILLESPIE, GEORGE (1613-48). A Scottish Presbyterian clergyman and prominent member of the Westminster Assembly. He was born at Kirkcaldy, near Leith. After a brilliant career as a student at St Andrews University he became domestic chaplain to Lord Kenmure, and in 1634 to the Earl of Cassilis. While with the Earl of Cassilis he wrote his first work, *A Dispute against the English Popish Ceremonies Obtruded upon the Church of Scotland* (1637), which attracted considerable attention, and within a few months all available copies were called in and burned by order of the Privy Council. In April, 1638, soon after the authority of the bishops had been set aside by the nation, Gillespie was ordained minister of Wemyss (Fife) by the Presbytery of Kirkcaldy, and in the same year preached a sermon before the General Assembly at Glasgow, pronouncing so decidedly against royal interference in matters ecclesiastical as to call for remonstrance on the part of the Earl of Argyll, then Lord High Commissioner. In 1642 Gillespie was transferred to Edinburgh, but the brief remainder of his life was chiefly spent in London. Already, in 1640, he had accompanied the commissioners of the peace to England as one of their chaplains, and in 1643 he was appointed to the Westminster Assembly. Here he took a prominent part in almost all of the protracted discussions on Church government. His works, which chiefly deal with the independence of the Church in spiritual matters, were published in Edinburgh (1843-48).

GILLESPIE, GEORGE DE NORMANDIE (1819-1909). A Protestant Episcopal bishop, born in Goshen, N. Y. He graduated at the General Theological Seminary, New York City, in 1840, and was ordained priest in 1843. He became rector of St. Mark's Church, Leroy, N. Y. (1841), St. Paul's Church, Cincinnati (1845), Zion Church, Palmyra, N. Y. (1851), and St. Andrews Church, Ann Arbor, Mich. (1861). In 1875 he was made Bishop of the diocese of Western Michigan, and in 1877 he became a member of the State Board of Charities and Correction. His writings include *The Communion of Saints*, *An Holy Priesthood*, *The Season of Lent*.

GILLESPIE, GEORGE LEWIS (1841-1913). An American military engineer, born at Kingston, Tenn. He graduated at West Point in 1862, and served with great gallantry throughout the Civil War. He was president of the Mississippi River Commission in 1885, and later was division engineer on the Atlantic coast. During the Spanish-American War he was in command of the Department of the East. In 1901 he became a brigadier general and chief of engineers, and in 1904 major general, serving on the general staff as assistant chief of staff. He was retired in 1905.

GILLESPIE, WILLIAM MITCHELL (1816-68). An American author, born in New York City. He graduated at Columbia in 1834, and from 1845 was professor of civil engineering in Union College. A forceful and profound scholar, he wrote *Rome as Seen by a New Yorker* (1845), *A Manual of Road-Making* (1847 and often), a translation of Comte's *Philosophy of Mathematics* (1851), *The Principles and Practice of Land-Surveying* (1855, 6th ed., 1858), a posthumously published *Treatise on Leveling, Topography, and Higher Surveying* (1871, edited by Staley), and other works.

GILLETT, jil-lét', EZRA HALL (1823-75). An

American clergyman and author, born at Colchester, Conn. He graduated in 1841 at Yale, and in 1844 at the Union Theological Seminary, and became pastor of a Presbyterian church in Harlem, N. Y. In 1868 he was appointed professor of political economy, ethics, and history in New York University. In addition to numerous contributions to theological reviews, he published the *Life and Times of John Huss* (1863-64), a *History of the Presbyterian Church in the United States* (1864), *The Moral System* (1874), and other works.

GILLETTE, WILLIAM HOOKER (1855-). An American actor and playwright. He was born in Hartford, Conn., and studied in the universities of New York and Boston, while applying himself to the theatre. He met with success as an actor in stock companies in the South and West, as well as in Boston and New York, and wrote a number of plays of great popularity, to the presenting of which he latterly devoted himself. Among them are *Digby's Secretary* (1880, an adaptation from the German, which was, by compromise, combined with Charles Hawtrey's play, *The Private Secretary*, from the same source), *Esmeralda* (1881) (in which he collaborated with Mrs. Burnett), *Held by the Enemy* (1886), *A Legal Wreck*, *Too Much Johnson* (1894), *Secret Service* (1895), *Because She Loved Him So* (1899), and *Clarice* (1906). He is best known by his dramatization of Sir Conan Doyle's *Sherlock Holmes* (1899) and his acting of the chief character. Consult Hapgood, *The Stage in America, 1897-1900* (New York, 1901), Strang, *Famous Actors of the Day in America* (Boston, 1900), Clapp and Edgett, *Players of the Present* (New York, 1899), Winter, *The Wallet of Time* (2 vols., ib., 1913).

GILLIE, gíl'li (Gael, Ir *giolla*, lad, manservant). A Highland attendant, a boy, page, or menial, an outdoor servant, especially one in attendance on persons engaged in hunting or traveling. Formerly, in Scotland, it was the duty of a servant, called a *gillie whitefoot* or *gillie webfoot*, to carry his master over brooks or watery places.

GILLIES, gíl'liz, JOHN (1747-1836). A Scottish historian and classical scholar. He was born at Brechin, in Forfarshire, and graduated at Glasgow University. A literary life in London was interrupted for a time by travels on the Continent, when he was tutor to the sons of John, Earl of Hopetoun. In 1793 Gillies was appointed royal historiographer for Scotland. His *History of Greece, its Colonies and Conquests* (1786), long superseded, was his most popular work, in its day it was of great value. He also wrote *A History of the World from Alexander the Great to Augustus* (1807) and published various translations, entitled *Orations of Lysias and Isocrates* (1778), *Aristotle's Ethics and Politics* (1797), and *Aristotle's Rhetoric* (1823).

GILLINGHAM, gíl'ing-am. A town in Kent, England, 1 mile east-northeast of Chatham. It has large dockyards, cement and brick works. It is the centre of a fruit growing district noted for its cherries. It has interesting archæological remains. Gillingham fort was built in the reign of Charles I. The Jezreelites, or the New and Latter House of Israel, have a large temple and school at Gillingham, which is their headquarters. The town was incorporated in 1903, it is governed by a mayor, 6 aldermen,

and 18 councilors. The Royal Naval Hospital was opened in 1905. Pop., 1901, 42,745, 1911, 52,252.

GILLIS (GILES) LAND An island to the east of Northeast Land, Spitzbergen, in lat 80° 10' N, long 30° 32' E. It was discovered in 1707 by a Dutch whaler, Cornelis Giles, or Gillis. Occasionally seen, it was never visited until its exploration in 1898 by Dr. A. G. Nathorst. Being entirely ice-capped, it has been called White Island and New Iceland.

GILLISS, gill'is, JAMES MELVILLE (1811-65). An American astronomer, born in Georgetown, D. C. He became a midshipman in the navy in 1827. He procured leave of absence in 1833, spent a year in scientific study at the University of Virginia, and continued his studies in Paris. In 1836 he became assistant in the Bureau of Charts and Instruments in Washington, and two years later, in a small wooden building belonging to the Navy Department, organized the first working observatory in the United States. He was made a lieutenant in 1838, and for five years conducted at Washington astronomical observations of great value, which were published by the government in 1846, containing the first catalogue of stars, and being the first report of astronomical observations to be published in America. In 1842-43 he visited Europe to procure the equipment for the new government observatory at Washington, completed under his direction in 1845. He spent the years 1848-52 in Chile, where he made observations for the determination of the solar parallax, and studied the constellations of the Southern Hemisphere. He observed solar eclipses in 1858 in Peru, and in 1860 on the northern Pacific coast of the United States, and after the departure of Lieut. M. F. Maury at the outbreak of the war, succeeded him as superintendent of the National Observatory at Washington, a position which he held until his death. Under his control the observatory became one of the best equipped in the world. He became a captain in 1862. His publications include *Astronomical Observations Made at the Naval Observatory* (1846), *The United States Astronomical Expedition to the Southern Hemisphere, 1849-52* (4 vols., 1854-58). Consult Gould, *Memoir*, in the *Biographical Memoirs of the National Academy of Sciences*, vol. 1 (Washington, 1877).

GILLIVARE. See LAPLAND.

GILLMORE, gill'môr, INEZ HAYNES (1873-) An American story writer. She was born at Rio de Janeiro, Brazil, and was educated in Boston public schools, at the Boston Normal School, and at Radcliffe College. She married Rufus Hamilton Gillmore in 1897. She was the first secretary of the first College Equal Suffrage League in America, and she became honorary vice president of the Massachusetts Woman Suffrage Association. She is author of *June Jeopardy* (1908), *Maudie's Little Shop* (1910), *Phæbe and Ernest* (1910); *Janey* (1911), *Phæbe, Ernest, and Cupid* (1912), *Angel Island* (1914), and contributions to magazines.

GILLMORE, gill'môr, QUINCY ADAMS (1825-88). An American soldier and eminent military engineer, born at Black River, Lorain Co., Ohio. Graduating at West Point in 1849, first in his class, and assigned to the Engineer Corps, he was assistant engineer in the building of Fortress Monroe until 1852, when he became assistant instructor of practical military engineering at West Point. From 1856 to 1861 he

was in charge of the Engineer Agency at New York, and in 1857-58 he was also in charge of the fortifications in New York harbor. During the Civil War he acted as chief engineer of the Port Royal Expeditionary Corps in 1861-62, was chief engineer at the siege of Fort Pulaski, Ga., from February to April, 1862, was in command during the bombardment and capture of that fort, and on April 28, 1862, was made brigadier general of volunteers. He then commanded successively the District of Western Virginia, the First Division of the Army of Kentucky, and the District of Central Kentucky, and on March 30, 1863, was brevetted colonel in the regular army. From June 12, 1863, to April, 1864, he was in command of the Department of the South, and from July 16, 1863, to June 17, 1864, of the Tenth Army Corps, during which time he conducted the land operations against Charleston, S. C., and participated in the battle of Drury's Bluff, Va., and in the defense of Bermuda Hundred. In July, 1864, he commanded two divisions of the Nineteenth Army Corps in the defense of Washington and the pursuit of General Early (qv). On March 13, 1865, he was brevetted successively brigadier general and major general in the regular army, and on Dec. 5, 1865, he resigned from the volunteer service. After the close of the war he served as superintending engineer of fortifications on the Atlantic coast and was in charge of various river and harbor improvements of importance. He was president of the Mississippi River Commission from 1870 to 1882, and became colonel of engineers in February, 1883. In 1876, as one of the judges at the Centennial Exposition, he presented to the Bureau of Awards several reports. He published *Siege and Reduction of Fort Pulaski* (1862); *A Practical Treatise on Limes, Hydraulic Cements, and Mortars* (1863), *Engineering and Artillery Operations against Charleston, S. C., in 1863* (1865, supplement 1868), *Béton, Coignet, and Other Artificial Stones* (1871), *The Compressive Strength, Specific Gravity, and Ratio of Absorption of Building Stones of the United States* (1876), and *A Practical Treatise on Roads, Streets, and Pavements* (1876).

GILLOT, jil'ôt, JOSEPH (1799-1873). An English manufacturer of steel pens, born at Sheffield. He first began the manufacture of pens in 1830, and gradually introduced improvements, both in the pen itself and in manufacturing processes, until his pens came to be almost universally used. He accumulated a large fortune, a part of which he expended in getting together a valuable collection of paintings.

GILL-OVER-THE-GROUND. See GROUND IVY.

GILLRAY, gil'rà, JAMES (1757-1815). An English caricaturist. He was born at Chelsea, in July, 1757, of Irish descent, but little is known of him until he became a student of the Royal Academy, where he made a special study of art designs. He began as an engraver, and his first works were two plates published in 1784, they were illustrations for Goldsmith's *Deserted Village*. In 1792 he visited France, Germany, and Holland, in the same year he published his well-known caricature "John Bull and his Family Landing at Boulogne," and the large plate after Northcote, inscribed "La triomphe de la liberté, ou l'élargissement de la Bastille." Gillray has no rival as a caricaturist of the politics and manners of the years 1779-1811. His car-

toons represent the fashionable society at Vauxhall Gardens, lords and ladies, singers, soldiers, life at home, in the taverns, in the villages, and in the poor quarter of London among the patient, struggling artisans, but the most celebrated are those satirizing King George III and his Queen, the Prince of Wales, Pitt, and Napoleon. His comedy was produced by the strongest contrasts. He was a masterly draftsman of a vehement style and amazing fertility of fancy, almost brutal and coarse at times, yet capable of expressing the most delicate feeling and beauty. His caricatures number more than 12,000, and his last work is dated 1811. His death, caused by intemperate habits, occurred in London, June 1, 1815. A satire on an "Irish Fortune-Hunter," or "Paddy on Horseback," is the earliest-known work, dated 1779, other political cartoons are "L'Assemblée nationale" or a "Grand Cooperative Meeting at St Anne's Hill" (1804), "A New Way to Pay the National Debt" (1796), "Temperance Enjoying a Frugal Meal" and a "Voluptuary under the Horrors of Digestion" (1792), "Anti-Saccharites" (1792), and "A Connoisseur Examining a Cooper" (1792)—the last two being fierce satires on the habits of the royal family. Among his social caricatures are "Two-Penny Whist", "The Life of William Cobbett, Written by Himself," eight satirical plates (1809), "Elements of Skating," four plates (1805), "Rake's Progress at the University," five plates (1806). Consult Buss, *English Graphic Satire* (London, 1874), Wright, *The Works of James Gillray, with Story of his Life and Times* (ib., 1874), Everitt, *English Caricaturists*. (ib., 1885).

GILLS, gîlz, 'SOLOMON. A ship's-instrument maker, in Dickens's *Domby and Son*, and a great crony of Capt Edward Cuttle.

GILLYFLOWER, jîl'i-flou'ër (ME. *gyllifer*, from OF *gilofre*, *grofite*, *grofre*, corrupted from ML *caryophyllum*, from Gk *καρυόφυλλον*, *karyophyllum*, clove tree, from *κάρυον*, *karyon*, nut + *φύλλον*, *phyllon*, leaf, confused by popular etymology with Eng. *flower*). A popular English name for some of the cruciferous plants, prized for the beauty and fragrance of their flowers, as wallflower, stock, etc. The clove pink, the wild original of the carnation, is also called clove gillyflower. The name is now used mostly for species of the genera *Cheiranthus* and *Matthiola*. Species of the former furnish the different varieties of wallflowers, and of the latter the various kinds of stock. See STOCK.

GILMAN, gîl'man, ARTHUR (1821-82). An American architect, born at Newburyport, Mass. After his graduation at Trinity College (Hartford, Conn.), he became known as a lecturer on architecture, and as a practical architect, whose earliest important work was the Boston City Hall. From 1865 he was a resident of New York City, where he designed the original building of the Equitable Insurance Company. The original design of the State Capitol at Albany, also, was his work, though it underwent material alteration under other hands. While a citizen of Boston, he was prominent in his endeavors for municipal improvement.

GILMAN, ARTHUR (1837-1909). An American educator. He was born in Alton, Ill., was educated in St Louis and New York, was engaged in banking in New York from 1857 to 1862, and then removed to Massachusetts, where he gave his attention chiefly to education and

religious instruction, and in 1871 became editor of the publications of the American Tract Society. In 1876, together with his wife, he devised a scheme for the collegiate instruction of women that developed into the Harvard Annex, of which he was executive officer. When in 1894 the Annex became Radcliffe College, he was its regent for two years. He founded, and in 1886 became the director of, the Gilman School for girls at Cambridge. Besides contributing to the magazines, he published *First Steps in English Literature* (1870), *Boston, Past and Present* (1873), *First Steps in General History* (1874), *Shakespeare's Morals* (1879), *History of the American People* (1883), *Tales of the Pathfinders* (1884), *The Story of the Saracens* (1886), *The Story of Rome* (1885) and *Germany* (1906, with Bairing-Gould), and other volumes in the "Story of the Nations" series, *The Discovery and Exploration of America* (1887), *The Making of the American Nation* (1887), *The Story of Boston* (1889), and edited various compilations.

GILMAN, CAROLINE HOWARD (1794-1888). An American author, born in Boston. She was the daughter of Samuel Howard, and married the Rev Samuel Gilman. Some of her works once enjoyed considerable popularity. Among them are *Recollections of a New England Housekeeper* (1835), *Recollections of a Southern Matron* (1836), *Poetry of Traveling in the United States* (1838), *Ruth Raymond* (1840), *Verses of a Life Time* (1849), and, with her daughter, Mrs Jervcy, *Poems and Stories by a Mother and Daughter* (1872).

GILMAN, CHARLOTTE PERKINS (1860-). An American lecturer and author, born at Hartford, Conn. She married C W Stetson in 1884 and George H Gilman in 1900. In 1890 she began giving lectures on ethics, economics, and sociology, and writing for the magazines on the same subjects. She became known especially for her interest in labor problems and for her advocacy of woman's rights. In 1914 a series of lectures which she gave in New York City on "The Larger Feminism" gained unusual attention. In 1909 she became editor of *The Forerunner*. Her writings include *Woman and Economics* (1898, 2d ed, 1899), *In This Our World*, a volume of verse (1898), *The Yellow Wall Paper* (1899), *Concerning Children* (1900), *The Home, Its Work and Influence* (1903, 1910), *Human Work* (1904), *What Diantha Did* (1910); *The Man-Made World* (1911); *The Cruc* (1911), *Moving the Mountain* (1911).

GILMAN, DANIEL COIT (1831-1908). An American educator, born in Norwich, Conn. He came from a New Hampshire family which migrated from Norfolk, England, in 1638. After graduating from Yale University in 1852, he studied and traveled in Europe. He was connected with Yale (1855-72) as librarian, professor of physical and political geography, and secretary of the Sheffield Scientific school, was president of the University of California (1872-75), and then, as president of Johns Hopkins University, Baltimore, during the first 25 years of its existence, he contributed notably toward the establishment of true university education in the United States. After his resignation he served until 1904 as president of the Carnegie Institution of Washington. He was also president of many educational and philanthropic associations, received numerous honorary degrees,

and was a member of the American Academy of Arts and Letters. He was appointed by President Cleveland one of the commissioners to determine the boundary line between Venezuela and British Guiana, he served as one of the Charter Commission of Baltimore, and he was president of the National Civil Service Reform League (1901-07) and of the American Oriental Society (1893-1906). As a member of three boards—the Peabody, the Slater, and the General Education—he was active in the promotion of education in the South. His publications include a large number of reports and magazine articles, an introduction to Lieber's minor writings, an introduction to De Tocqueville's *Democracy in America*, a volume of speeches and essays entitled *University Problems*, a small volume on *Science and Letters in Yale*, and a memoir of James Dwight Dana, the geologist. To the American Statesmen Series he contributed a memoir of President Monroe. In 1901 he became one of the three general editors of the first edition of the NEW INTERNATIONAL ENCYCLOPEDIA. Consult Franklin, *Life of Daniel C. Gilman* (New York, 1910).—His brother, EDWARD WHITING GILMAN (1823-1900), was born at Norwich, Conn., graduated at Yale in 1843, and, after studying theology at Union Theological Seminary and Yale Divinity School, was a tutor at Yale, and in 1849 was ordained a Congregational minister. From 1871 until his death he was corresponding secretary of the American Bible Society, being chiefly concerned with its wide foreign correspondence.

GILMAN, JOHN TAYLOR (1753-1828). An American Federalist political leader, Governor of New Hampshire for fourteen terms. He was born at Exeter, N. H., the son of Nicholas Gilman, a Revolutionary leader, and a brother of United States Senator Nicholas Gilman (qv). He was educated at Exeter and became a shipbuilder. The day following the battle of Lexington he marched to Cambridge with the first company of minutemen from New Hampshire, and subsequently served as an aid to his father, who commanded the regiment of New Hampshire troops at the siege of Boston. Later he became assistant to his father, then State Treasurer. His first political office was in the State Legislature in 1779. He was a delegate from New Hampshire to the convention held in 1780 at Hartford, Conn., to devise means for the continuation of the war. In 1782-83 he was a member of the Continental Congress, resigning to accept the office of State Treasurer, in succession to his father. In 1786 he resigned the treasurership to act as commissioner, with John Kean of South Carolina and William Irvine of Pennsylvania, to settle the accounts of the old Confederation with the several States. In 1788 he was a member of the New Hampshire Convention to adopt the Federal Constitution. After another year's service as State Treasurer, he was elected, in 1794, Governor of New Hampshire. This office he held until the close of 1805, and again from 1813 to 1816. Although opposed to the war policy of the national government, he engaged actively in providing defenses for the New Hampshire coast and frontier. He sympathized with the movement that resulted in the Hartford Convention of 1814, but refused to take any action in the matter of sending delegates from New Hampshire, which was therefore represented only unofficially. In 1816 he declined a reelection, and retired to

private life. Consult *The Gilman Family* (Albany, 1869).

GILMAN, LAWRENCE (1878-) An American writer on music. He was born at Flushing, N. Y., and studied art under W. M. Chase and at the Art Students' League of New York. From 1896 to 1898 he was on the staff of the New York *Herald*. At the same time he studied diligently by himself piano, organ, and composition. In 1901 he became musical critic of *Harper's Weekly*, in 1901 assistant editor, in 1911 managing editor. In his writings he shows himself thoroughly in sympathy with the most advanced thought in modern music. His more important books are *Phases of Modern Music* (1904), *Edward MacDowell* (1905, revised and expanded 1909), *A Guide to Strauss' Salome* (1907), *A Guide to Debussy's Pelléas et Mélisande* (1907), *Aspects of Modern Opera* (1908). He also became known as a frequent contributor to leading magazines.

GILMAN, NICHOLAS (1755-1814). An American statesman, born at Exeter, N. H., son of Nicholas Gilman (1731-1813), who served with John Langdon during the Revolution and was State Treasurer in 1776-83. Nicholas the younger served during the Revolutionary War as adjutant in the First New Hampshire Regiment (Col. Alexander Scammell's), in 1786-88 was a member of the Continental Congress, and in 1787 of the Constitutional Convention at Philadelphia. From 1789 to 1797 he sat in the House of Representatives, and from 1805 until his death in the Senate.

GILMAN, NICHOLAS PAINE (1849-1912). An American author, journalist, and clergyman, born at Quincy, Ill. He graduated at the Harvard Divinity School in 1871, was pastor of various Unitarian churches in Massachusetts from 1872 to 1878 and in 1881-84, and professor of English literature at Antioch College, Yellow Springs, Ohio, in 1878-81. From 1885 to 1889 he was assistant editor of the *Unitarian Review*, from 1889 to 1895 editor of the *Literary World* (Boston), and in 1892-1900 editor of the *New World*, a Unitarian quarterly. In 1895 he was appointed to the chair of sociology and ethics in the Meadville (Pa.) Theological Seminary. He wrote *Profit-Sharing between Employer and Employee. A Study in the Evolution of the Wages System* (1889), which was translated into German, and received a gold medal at the Paris Exposition of 1889, *Conduct as a Fine Art. The Laws of Daily Conduct* (1891), a nonsectarian textbook of ethics, *Socialism and the American Spirit* (1893, 2d ed., 1896), *A Dividend to Labor. A Study of Employers' Welfare Institutions* (1899), *Methods of Industrial Peace* (1904).

GILMAN, SAMUEL (1791-1858). Clergyman and author. He was born at Gloucester, Mass., graduated at Harvard in 1811, and in 1819 was ordained pastor of the Unitarian church at Charleston, S. C., which he continued to serve till his death. He was an active advocate of the temperance cause, and published *Memoirs of a New England Village Choir* (1829), *Pleasures and Pains of a Student's Life* (1852), *Contributions to Literature, Descriptive, Critical, Humorous, Biographical, Philosophical, and Poetical* (1856), as well as contributions to periodicals and translations of certain of Boileau's satires.

GILMER, gil'mēr, GEORGE ROCKINGHAM (1790-1859). An American lawyer and gov-

ernor, born at Lexington, Ga. He was in the army in 1813-18. After serving in the State Legislature (1818-20), where he began the agitation for the establishment of the Supreme Court, he was twice Governor of Georgia (1829-31, 1837-39), a member of Congress (1821-23, 1827-29, 1833-35), and presidential elector for Hugh J. White (1836) and for Harrison (1840). Consult his *Georgians Sketches of Some of the First Settlers of Upper Georgia, of the Cherokees, and the Author* (New York, 1855).

GILMER, JEREMY FRANCIS (1818-83). An American soldier, born in Guilford Co., N. C. He entered the engineers upon his graduation from the United States Military Academy in 1839 (with Halleck, Canby, Hunt, and Ord), saw service in the Mexican War, and surveyed battlefields near the city of Mexico, and until 1861 was active in making surveys, constructing fortifications, and executing various river and harbor improvements. Upon the outbreak of the Civil War he entered the Confederate service, was appointed major of engineers, and became chief engineer on the staff of Gen. A. S. Johnston. He was wounded at the battle of Shiloh, was later appointed chief of the engineering bureau at Richmond, and in 1863 was commissioned major general in the Confederate army. In 1867-83 he was president and engineer of the Savannah Gas Company.

GILMOR, gíl'môr, HARRY (1838-83). An American soldier, born in Baltimore Co., Md. He entered the Confederate army in 1861, was commissioned captain in 1862, in 1862-63 was imprisoned for five months at Fort McHenry, and in 1863 raised a cavalry battalion, of which he was made major. He commanded the First Confederate Regiment of Maryland and in 1864 headed the advance of the forces of Gen. J. A. Early into Maryland. In 1874 he became police commissioner of Baltimore. He wrote *Four Years in the Saddle* (1866).

GILMORE, gíl'môr, JAMES ROBERTS (1822-1903). An American writer and editor, born in Boston, Mass. He entered a counting room in 1836 and in 1847 established in New York City a cotton and shipping firm which did a leading business in several Southern States. He was its president until 1857, when he retired from commercial life. In 1862, with Robert J. Walker, ex-Secretary of the United States Treasury, and Charles G. Leland ("Hans Breitmann"), he founded in New York the *Continental Monthly*, devoted chiefly to the cause of emancipation, his interest in which he relinquished to Walker in 1863. In that year he became an occasional editorial writer for the *New York Tribune*. In the summer of 1864 he and Col. James F. Jaquess, as unofficial agents of President Lincoln, went to Richmond to lay before President Jefferson Davis various peace proposals. These were immediately rejected, since they did not provide for recognition of the independence of the Confederacy. Gilmore's account of this mission in the *Atlantic Monthly* undoubtedly did much to break the ranks of the peace party in the North and to influence many to vote for Lincoln rather than McClellan in November, 1864. Gilmore engaged in business again in 1873, but retired 10 years later to devote himself wholly to literature. His popular historical works have been much criticized by special students, but they are of great general value. His earlier books were published under

the nom de plume of "Edmund Kirke." His writings include *Among the Pines* (1862), *My Southern Friends* (1862), *Down in Tennessee* (1863), *Adrift in Dixie* (1863), *Among the Guerrillas* (1863), *On the Border* (1864), *Patriot Boys* (1864), *A Campaign Life of Garfield* (1880), *The Rear Guard of the Revolution* (1886), *John Sevier as a Commonwealth Builder* (1887), *Advance Guard of Western Civilization* (1888), *A Mountain White Heroine* (1889), *The Last of the Thorndikes* (1889), *Personal Recollections of Abraham Lincoln and the Civil War* (1898).

GILMORE, JOSEPH ALBREE (1811-67). An American politician, war Governor of New Hampshire. He was born in Weston, Vt. He had very little schooling, and his early business experience was obtained in a store in Boston. In 1832 he settled at Concord, N. H., where he became the proprietor of a large grocery store. In 1848 he became interested in railroading as a constructing agent, and was general superintendent of the Concord and Claremont Railroad until 1866—after the road was consolidated with the Manchester and Lawrence and other connecting roads. In 1858 he was elected to the New Hampshire State Senate as a Republican. He was reelected in the following year and chosen President. In March, 1863, he was nominated for Governor by the Republicans, when none of the three candidates received a majority of votes as required by the State constitution for an election by the people, the Legislature chose Gilmore, and in 1864 he was reelected by the people. His administration of the office during the most trying period of the Civil War was marked by great energy and firmness, and largely through his exertions New Hampshire's contribution to the Union armies was increased from 15,500 to 33,258, an excess of 1800 over the State's quota.

GILMORE, JOSEPH HENRY (1834-1918). An American educator, born in Boston. In 1858 he graduated from Brown University (A. M., 1861), and in 1861 from Newton Theological Institution. Ordained to the Baptist ministry in 1862, he was pastor at Fisherville, N. H., until 1864, and at Rochester, N. Y., until 1867. He edited the Concord (N. H.) *Daily Monitor* in 1864-65, was acting professor of Hebrew at the Rochester Theological Seminary in 1867-68, and for 40 years, until he became professor emeritus in 1908, occupied the chair of rhetoric, logic, and English at the University of Rochester. He wrote the widely used hymn "He Leadeth Me," and published, besides a number of textbooks on rhetoric and speaking, *Familiar Chats about Books and Reading* (1892) and *Outlines of English and American Literature* (1905).

GILMORE, PATRICK SANSFIELD (1829-92). A celebrated American military bandmaster, born near Dublin, Ireland. His first musical experience was with the town band of Athlone, and when but 18 years of age he left his native city to go to Canada with an English band. Almost immediately on his arrival he crossed the boundary into the United States and settled in Salem, Mass., where he became conductor of a military band. The National Peace Jubilee of 1869, and the World's Peace Jubilee of 1872, held on Boston Common, gained him an international reputation. The entire musical ensemble in 1869 consisted of an orchestra of 1000, and a chorus of 10,000 voices,

which number was doubled in the festival of 1872. Having settled in New York in 1874, Gilmore and his band began concert tours which were as popular as they were successful, the tours covering Canada, Great Britain, and several continental European cities of importance. His successor in this branch of musical organization was Sousa (qv). He died in St. Louis, Mo.

GILMOUR, gîl'mûr, RICHARD (1824-91). A Roman Catholic bishop of Cleveland, Ohio, born in Glasgow, Scotland. In 1842 he became a Catholic, he had been a Scottish Covenanter. He was educated at Mount St. Mary's College, Emmitsburg, Md., and in 1852 was ordained priest. Consecrated Bishop of Cleveland in 1872, he became widely known for his interest in Catholic education, establishing *The Catholic Universe* (1874) and organizing the Catholic Central Association (1875). He wrote a *Bible History* (1869) and compiled readers, primers, and spelling books called *The Catholic National Series*.

GILOLO, jê-lô'lo, or HALMAHERA (native name, *Bato-tsima*). The largest of the Moluccas (qv) or Spice Islands, situated between lat. 2° N and 1° S and long. 127° 27' and 129° E, east of Celebes (Map East Indies, G 5). Its area is estimated at over 6950 square miles. It is very irregular in its form, which resembles Celebes in its peninsular configuration. The surface is mountainous and the climate tropical. The soil is of great fertility. The island belongs to the Netherlands, and is included in the Residency of Ternate. The chief towns are Galela and Patani. The population is estimated at 100,000 and consists of Malays and Alfuros.

GILPIN, gîl'pîn, BERNARD (1517-83). An English clergyman, known as the "Apostle of the North." He was born at Kentmere, Westmoreland. He studied at Queen's College, Oxford. Soon after graduation he was chosen fellow of his college and took orders in 1542. On the opening of the new foundation of Christ Church, Wolsey made him one of the head masters. At that time the university was divided on the subject of the Reformation. Gilpin at first took ground against it, but later embraced it. In 1552 he became vicar of Norton and was licensed by Edward VI as a "general preacher." On the King's death he went abroad and lived at Louvain and Paris. Returning to England during Queen Mary's reign, he found the persecution of the Protestants still in progress. His uncle, Bishop Tunstall, of Durham, gave him the living of Easington and the archdeaconry of Durham, later the rectory of Houghton-le-Spring, protecting him also, notwithstanding his open avowal of Protestant opinions. He devoted himself to the diligent prosecution of his parish work and to itinerant labors through the country. Queen Elizabeth offered him the bishopric of Carlisle, which he declined. He continued until his death rector of Houghton, residing constantly in his parish except when he visited the ruder parts of the county of Northumberland. The people in certain districts had long led a lawless life, subsisting mostly on plunder. Gilpin went fearlessly among them and did much to change the character of the country. His chief labors, however, were in his own parish of Houghton, which included 14 villages. He organized and endowed a school, and expended his funds freely for education and charity. He was a bachelor and in hospitality resembled the char-

acter ascribed to the primitive bishops. Every fortnight 40 bushels of corn, 20 bushels of malt, and a whole ox were consumed in his house, besides ample supplies of many other kinds. He maintained an open table for his people every Sunday from Michaelmas to Easter. The rectory house was also open to all travelers, and so great was the reverence which surrounded him that his liberality was rarely abused. He died at Houghton-le-Spring, March 4, 1583. Consult his life by Carleton (London, 1629, reprinted, Glasgow, 1852), also the life by Collingwood (London, 1884). Four of his sermons were reprinted (Houghton-le-Spring, 1835).

GILPIN, HENRY DILWOOD (1801-60). An American lawyer. He was born in Lancaster, England, where his father, Joshua Gilpin, a Philadelphia manufacturer and author, was living at the time. He graduated at the University of Pennsylvania in 1819, was admitted to the bar in 1822, and rapidly established himself in an extensive practice in Philadelphia. In 1832 he was appointed by Jackson to succeed Dallas as United States District Attorney for Pennsylvania and served until 1837. In 1832-34 he was one of the government directors of the United States Bank and actively seconded Jackson's radical efforts to destroy that institution. This activity reacted upon him towards the end of the administration, when the Senate refused to confirm his appointment as Governor of Michigan Territory. In 1837 he was appointed by Van Buren Solicitor of the United States Treasury, and in 1840 he was appointed Attorney-General of the United States, a position which he retained until the inauguration of President Harrison. He spent his remaining years in travel and literary pursuits and in the practice of his profession, for the next 20 years he was one of the best-known members of the American bar. From 1826 to 1832 he edited the *Atlantic Souvenir*, the first American literary annual. He was a frequent contributor to magazines and reviews. Besides legal reports, he edited *The Papers of James Madison* (3 vols., 1840) and *Opinions of the Attorney-Generals of the United States from the Beginning of the Government to 1841* (2 vols., 1841). He also published *Biography of the Signers of the Declaration of Independence* (1826), a translation of Chaptal's *Essay on Import Duties and Prohibitions* (1841), *Life of Martin Van Buren* (1844). Consult the *Memorial* compiled by his wife (Philadelphia, 1860).

GILPIN, JOHN. The hero of a humorous poem by William Cowper (qv), first published in the *Public Advertiser* in 1782. Cowper heard the story from Lady Austen, who in turn had heard it in her childhood. As to the historical reality of John Gilpin, there is a discussion in *Notes and Queries* (London, 2d series, viii, ix, 1856, 3d series, ii, 1862, 5th series, ix, 1874, 6th series, i, ii, v, 1880).

GILPIN, WILLIAM (1724-1804). An English author, born at Scaleby Castle, near Carlisle, and educated at Oxford. For 30 years he conducted a school at Cheam, Surrey, where he introduced with much success important educational reforms. His works, embracing biographies, descriptions of natural scenery, and religious publications, include *Lives of Bernard Gilpin, Latimer, Cobham, Huss, Wycliffe, Zisca, Jerome of Prague, Lectures on the Church Catechism* (1779), *Exposition of the New Testament* (1790), *Remarks on Forest Scenery*

and *Other Woodland Views* (1790); and many volumes describing the British Isles, illustrated by his sketches in summer vacations

GIL POLO, Həl pō'lo, GASP. See POLO, GASP. See GIL

GILSONITE, gil'son-it (named in honor of S. H. Gilson, owner of a large deposit of the mineral) A black, brilliant bitumen, with conchoidal fracture, hardness 2 to 2.5 and specific gravity 1.065 to 1.07. It is found in veins in the Tertiary shales of northeastern Utah and western Colorado. Gilsonite is a nonconductor of heat and electricity and is soluble in carbon disulphide, chloroform, and warm oil of turpentine. An analysis gave C, 88.30, H, 9.96, N + O, 0.32, S, 1.32, ash, 0.10. The mineral is utilized in making paints and varnishes. Consult Eldridge, "The Uintahite (Gilsonite) Deposits of Utah," *Seventeenth Annual Report United States Geological Survey*, part 1 (Washington, 1896). See ASPHALT

GILT'HEAD' (so called from the coloring on its head) A small fish (*Sparus auratus*) of the family Sparidae, to which the scup, porgy, and sheepshead belong. It is numerous on the coast of Europe and Africa, near the shore in small shoals, feeding upon shellfish. The back is silvery gray, shaded with blue, the belly like polished steel, the sides have golden bands, and there is a half-moon-shaped golden spot between the eyes, from which it derives the name "gilt-head." This fish was very generally kept in the *vivaria* of the ancient Romans, being much valued and easily fattened. The name is also given to a British wrasse (q.v.)

GIL VICENTE, zhél vè-sán'tá. See VICENTE

GIL Y ZÁRATE, hél é tha'ra-tá, ANTONIO (1793-1861). A Spanish dramatist and literary historian, born in the Escorial. He was educated in France and upon his return to Spain was employed in the Ministry of the Interior. His earlier literary activity (1826-29) was hampered by the political and ecclesiastical censorship, though in this period he produced the tragedy *Doña Blanca de Borbón*. He became the editor of several of the Opposition journals and afterward held a number of official positions, including those of director and sub-secretary in the ministries of Commerce, Instruction, and Public Works. After some years he again turned to literature. His works include the tragedy *Don Rodrigo*; the dramas *Carlos II el hechizado*, *Don Alvaro de Luna*, and *Guzmán el bueno*, and the comedy *Don Pedro de Portugal*, and others. His dramatic works were published in Paris in 1850. He also wrote *De la instrucción pública en España* (1855), a *Manual de literatura* (4th ed., Madrid, 1851-56), and some critical studies.

GIMBALS, gim'balz (ME. *gemel*, from OF. *gemeau*, fem. *gemelle*, twin, from Lat. *gemellus*, twin) A contrivance for suspending objects on board ship so that they may remain horizontal or vertical notwithstanding the motion of the ship. As usually fitted, it consists of a ring carrying pivots on its circumference which rest in sockets in a frame or box, and of a second set of pivots on the object (as a compass or mercurial barometer) which rest in sockets so placed on the inner surface of the ring as to permit an oscillatory motion at right angles to that of the ring.

GIMLET, gim'lét. See BORING MACHINERY

GIMLI, gém'lé (Icel. heaven's roof) In

Noise mythology, a great hall at the world's southern end, brighter than the sun. It will stand when heaven and earth have passed away, and good and upright men will inhabit the place to all eternity.

GIMP, or **GYMP** (from Fr. *gumpe*, nun's wimple, from OF. *gumple*, wimple, OHG. *uim-pal*, veil, Eng. *wimple*) A kind of trimming for dress, curtains, furniture, etc., made either of silk, wool, or cotton. Its peculiarity is that it consists of a fine wire or cord whipped around and completely covered with fine thread. See LACE

GIN, jín (from *geneva*, from Dutch *geneve*, from OF. *genevre*, Fr. *genèvre*, juniper, from Lat. *juniperus*, juniper), or **GENEVA**. An alcoholic drink distilled from malt or from malt and unmalted barley or other grain and afterward rectified and flavored with juniper berries. The imitation gin which forms the common spirituous drink of the lower classes of London and vicinity is alcohol flavored with oil of turpentine and common salt, each rectifier having his own particular recipe for regulating the quantities to be used. The alcoholic strength of gin, as commonly sold, ranges from 22 to 48 per cent. The amount of sugar varies from 2 to 9 per cent. The larger part by far of the spirit is made in Holland and is exported to other countries, especially to America and northern Europe. See LIQUORS

GIN, COTTON. See COTTON, COTTON GIN, COTTON SEED

GINAIN, zhé'nán', PAUL RENÉ LÉON (1825-98). A French architect, born in Paris. A pupil of Lebas, he won the Grand Prix de Rome in 1852. After his return from Italy he practiced in Paris and in 1859 won one of the prizes in the competition for the new Opera House (See GARNIER, JEAN LOUIS CHARLES). He was professor at the Ecole des Beaux-Arts from 1880 until his death. He designed the church of Notre Dame des Champs, the Lying-in Hospital, the library of the School of Medicine, and several other schools. His most admirable work was the Musée Galliera, the most beautiful of the lesser public buildings of Paris.

GINATILÁN, hé'na-té-lan'. A town of Cebu, Philippines, situated on the southwest coast, at the mouth of the Río Ginatilán. It is in a level section, where corn, rice, millet, sugar cane, tobacco, cotton, cacao, etc., are cultivated, and the forests of the vicinity yield valuable timber. Pop., 10,617.

GINCKELL, G. See GINKEL, G.

GINDELY, gén'de-lé, ANTON (1829-92). An Austrian historian, born and educated in Prague. He was appointed professor at the Oberrealschule in 1853 and at the university in 1862. About the same time he was made archivist for the Kingdom of Bohemia. Besides the important *Geschichte des dreissigjährigen Krieges* (1869-80), not completed, his principal publications include *Geschichte der böhmischen Brüder* (1856-57), *Rudolf II und seine Zeit* (1862-65), *Waldstein während seines ersten Generalats* (1886), which provoked violent opposition, and *Ueber des Johann Amos Comenius Leben und Wirksamkeit* (2d ed., 1893). Posthumously appeared *Geschichte der Gegenreformation in Böhmen*, ed. by Tupetz (1893), and *Beiträge zur Geschichte des dreissigjährigen Krieges*, ed. by Hirn (1900). He also contributed numerous essays to the *Abhandlungen* of the Vienna Academy and from 1877 to 1892

edited *Bohmische Landtagsverhandlungen von 1526 an bis auf die Neuzeit*

GINES DE PASSAMONTE, hē'nās dā pas'sa-mōn'tā One of the many thankless debtors to the chivalry of Don Quixote, in Cervantes' romance of that name. He is a galley slave whom the knight sets free and who immediately joins his fellows in attacking their rescuer.

GINÉS DE SEPÚLVEDA, JUAN See SEPÚLVEDA.

GINEVRA, jē-nēv'ra An Italian bride whose tragic fate was commemorated by Samuel Rogers in a poem entitled "Italy." On her wedding day she concealed herself in sport within an oaken chest whose spring lock fastened her down. The guests sought for her in vain and not until years had passed was it discovered how she had met her death. The chest and a portrait of the lady were shown to the poet on his visit to Modena.

GINGER, jīn'jēr (AS *gingiber*, OF *gengibre*, from Lat. *zingiber*, Gk *ζινγίβηρις*, *zingiberis*, ginger, from Ar, Peis *zanjabāl*, from Prak *śingabāra*, from Skt *śrngavera*, ginger), *Zingiber* A genus of plants of the family Zingiberaceæ, natives of the East Indies. The species, of which there are about 20, are perennial herbs with annual stems, creeping rootstocks, and leaves in two opposite rows. The flowers are in compact spikes with bracts. The rootstocks of most of the species are used as a condiment and in medicine. The most valuable and generally used are those of the common ginger (*Zingiber officinale*), sometimes distinguished as the narrow-leaved ginger, now cultivated in various tropical countries. In the East Indies this plant has been cultivated from time immemorial, in the West Indies, particularly in Jamaica, from whence the finest quality is derived, and Sierra Leone, from both of which, as well as from the East Indies, its rootstocks—the ginger of commerce—are a considerable article of export. Like the banana and other plants that have long been in cultivation, ginger is grown wholly from cuttings, having apparently lost the ability to set seed. The rootstock is about the thickness of a man's finger, knotty, fibrous, and fleshy when fresh. The stems are reedlike, generally 3 or 4 feet high, invested with smooth sheaths of the linear-lanceolate smooth leaves. The flowers are not produced on the leafy stems, but on short scapes in spikes about the size of a man's thumb, and are of a whitish color, the lip streaked with purple. The cultivation of ginger is extremely easy wherever the climate is suitable. In India it is carried on to an elevation of 4000 or 5000 feet on the Himalayas, in moist situations. It may be cultivated at higher latitudes if the rootstocks are taken up and protected during the winter. In harvesting the crop the rootstock is taken up when the stems have withered and is prepared for the market either by scalding in boiling water—in order to kill it—and subsequent drying, or by scraping and washing. The first method yields black or coated ginger, the second white or scraped ginger, the blackest of black ginger, however, being only a stone color, and the whitest of white ginger very far from perfectly white, unless bleaching be employed, as is done not unfrequently to improve its appearance—a process not otherwise advantageous. Ginger found in the shops is sometimes covered with a white coating, usually of lime

This is thought to improve its appearance, but usually covers an inferior grade. There is a considerable difference, however, in the original color of the rootstocks of ginger of different countries, which is supposed to be owing to difference in the varieties cultivated. The uses of ginger, both in medicine as a stimulant and a carminative, and in domestic economy as a condiment, are too well known to require particular notice. The principal constituents of ginger root are a pale yellow volatile oil called "oil of ginger," gingerol, oleoresin, and often as much as 20 per cent of starch. The yield of oleoresin is from 5 to 8 per cent. Medicinally ginger is used as a fluid extract, oleoresin, tincture, powder, and in various standard preparations as compound rhubarb powder, etc. Candied ginger, or preserved ginger, consists of the young rootstocks preserved in sugar and is now exported in considerable quantity from China as well as from the East and the West Indies. It is a delicious sweetmeat, and is useful also as a stomachic. Essence of ginger, much used for flavoring, is in reality a tincture prepared of ginger and alcohol. Sirup of ginger is used chiefly by druggists for flavoring. Ginger tea, an infusion of ginger in boiling water, is a domestic remedy very useful in cases of flatulence. Ginger beer is a well-known beverage flavored with ginger. Ginger wine is a cheap liquor flavored with ginger. Ginger was known to the Romans and is said by Pliny to have been brought from Arabia.

Another species of ginger is zerumbet (*Zingiber zerumbet*), also called broad-leaved ginger, cultivated in Java, and of which the rootstock is sometimes erroneously called round zedoary. The rootstock is much thicker than that of common ginger and is less pungent. The rootstock of the cassumunar (*Zingiber cassumunar*), sometimes called yellow zedoary, has a camphor-like smell and a bitter aromatic taste. It acquired a high reputation in England and throughout Europe about the close of the seventeenth century as a stimulant and stomachic, but it soon sank into disuse. The rootstock of the mioga (*Zingiber mioga*) is less pungent than ginger and is much used in Japan. Cattle sent to graze in the jungles of northern India during the rainy season are said to be fed the rootstock of a species of ginger (*Zingiber capitatum*) to preserve their health. The root of *Asarum canadense* is sometimes called Indian ginger, or wild ginger, in North America, and is used as a substitute for ginger. It has a grateful aromatic odor and taste and is stimulant, tonic, and diaphoretic. See ASARABACCA, Plate of FLAVORING PLANTS.

GINGER, WILD See ASARABACCA.

GINGERBREAD TREE See DOOM PALM.

GINGER FAMILY See ZINGIBERACEÆ.

GINGHAM, gīng'am (probably from Javanese *ging-gang*, perishable, fading, less plausibly from Fr *Guingamp*, a town in Brittany). A cotton fabric of plain weave, originally introduced from India. It differs from calico in that its colors are dyed in the yarn and woven in in stripes or checks and not afterward printed. At first the Indian ginghams consisted of cotton cloths, with two or more colors arranged as a small checkered pattern, now a great variety of designs and color combinations are found in this material, which is used for women's and children's summer gowns and aprons. The whole piece is woven with yarn of one color.

Other cotton stuffs, such as zephyrs and chambrays, partake of the nature of gingham

GINGIVI'TIS See GUMS, DISEASES OF

GINGUENÉ, zhān'ge-nā', PIERRE LOUIS (1748-1816) A French man of letters, born at Rennes. He first came into prominence through his critical articles to the *Mercur de France* and later by his verses. In 1791 he published *Lettres sur les Confessions de J J Rousseau*, in which he praises Rousseau. In the beginning of the Revolution he spread the principles of justice and of liberty in his paper, *La Feuille Villageoise* (1791-94), but when his paper criticized the ensuing excesses, Ginguéné was imprisoned. As Director General of the Commission of Public Instruction, he aided greatly in the reorganization of popular education from 1794 until 1797, when he was appointed by the Directory Minister Plenipotentiary to Sardinia. In 1799-1802 he was a member of the tribunate. Meanwhile he had been contributing to the *Histoire littéraire de la France* (begun by the Benedictines). The last years of his life were devoted to his *Histoire littéraire de l'Italie*, completed by Salfi (1811-19, 2d ed, by Daunou, 14 vols, 1824-35)

GINIGARÁN See JINGARÁN

GINKEL, gīn'kel, or GINCKELL GODART VAN (1630-1703), first EARL OF ATHLONE. A Dutch general in the English army. The eldest son of Godard Adriaan van Reede, Baron Ginkel, he was born at Utrecht in 1630. He was trained for the army and in 1688 accompanied William of Orange to England. The following year he distinguished himself in the capture of a mutinous Scottish regiment at Sleaford, Lincolnshire, and in 1690 went to Ireland with the King and was conspicuous in command of a body of Dutch cavalry at the battle of the Boyne. He was left as general in chief when William returned to England. He captured Ballymore, reduced Athlone, defeated Saint-Ruth at Aughrim with terrible slaughter, marched on Galway, which capitulated, and completed the conquest of Ireland by taking Limerick. His return to London through England resembled a triumphal progress. He received the thanks of Parliament and was created Baron of Aughrim and Earl of Athlone. He continued in the English service and in 1692 accompanied William to the Continent. He was present at the battle of Landen and assisted in the destruction of the French magazines and stores at Givet. At the renewal of hostilities in 1702 he commanded the Dutch troops under Marlborough, but before the campaign had proceeded far, died, after two days' illness, at Utrecht, Feb 11, 1703.

GINKGO, gīnk'gō or jīnk'gō (Jap, from Chin *ynhng*, silver apricot, from *yn*, silver + *hng*, apricot). A genus of plants represented by a single living species, which is the sole survivor of an important ancient group of gymnosperms known as the Ginkgoales. The *Ginkgo biloba* is the well-known maidenhair tree of cultivation, a popular name suggested by the fact that the leaves resemble those of the ordinary maidenhair fern (*Adiantum*). It has been cultivated for centuries in China and Japan as a sacred tree in connection with temple groves, and it has become common in ornamental cultivation in all civilized countries.

The tree has the general habit of a conifer, with central shaft and wide-spreading branches.

It is recorded that it sometimes reaches a height of nearly 100 feet and a trunk circumference of more than 25 feet. The characteristic leaves have long and slender petioles, with broad, wedge-shaped, and variously lobed blades, and a distinctly forking vein system. The leaves are also deciduous, a very rare habit among gymnosperms. The spore-bearing organs—i.e., the stamens and ovules—are borne upon short, spurlike shoots, the stamens being in loose, catkin-like clusters while the ovules usually occur in pairs at the summit of a long stalk. As a rule, but a single one of the pair of ovules develops into the mature seed, a development which occurs whether fertilization takes place or not.

Formerly *Ginkgo* was included among the conifers, but further knowledge of its structure has caused it to be set apart as a group by itself, equal in rank to Cycadales, Coniferales, and Gnetales, the other three living groups of gymnosperms. Prominent among the recent discoveries in connection with *Ginkgo* has been the discovery of ciliated (hence motile) male cells, identical in general character with those discovered in the Cycadales (qv). The embryo is an exception among gymnosperms, since it does not develop the usual long and slender suspensor. As in the cycads, the embryo develops two cotyledons, and between them there is a very conspicuous plumule (shoot bud). *Ginkgo* also shares with cycads the feature that its seed becomes plumlike, a testa with fleshy outer and stony inner layers being organized. Often without pollination, and hence, of course, without fertilization, the seed attains its usual size, and the two layers of the testa are developed. The starchy kernel of the seed has an almond-like flavor and is eaten, after slight roasting, by the Chinese.

The *Ginkgo* was introduced into the United States towards the close of the eighteenth century, and, because of its symmetrical shape and freedom from attacks of injurious fungi and insects, it has come into favor as an ornamental and street tree. It is hardy as far north as Massachusetts, and at Washington, D C, it grows quite well, several streets being planted with this species. Where employed as a street tree, only staminate specimens should be planted, so as to escape the annoyance of the falling disagreeable-smelling fruits in autumn.

The leaves of *Ginkgo* are so characteristic that they are unusually trustworthy evidence of the existence of the group as fossils. Such leaves are found in abundance down to the Coal Measures, and some of them at least must have belonged to Ginkgoales. The most important fossil leaf genus referred to this order is the Mesozoic *Baiera*. It is evident that Ginkgoales were abundant and somewhat diversified during the Mesozoic, their greatest extension occurring during the Jurassic, and it is altogether probable that they existed near the close of the Paleozoic. Jurassic remains of the group have been found in every country, from the Arctic regions to the south temperate regions, being abundant in England, throughout Europe, Siberia, China, Japan, North America, and Australia. The prominent genera were *Ginkgo* and *Baiera*—the former becoming more abundant in the more recent periods and in the more northern latitudes, the latter including the majority of the older representatives of the group. Consult A C Seward, "Maidenhair Tree (*Ginkgo*

biloba)," in *Annals of Botany*, vol xiv (London, 1900), and S W Maury, *The Ginkgo* (New York, 1910) See Plate of GYMNOSPERMS

GINN, gin, EDWIN (1838-1914) An American publisher and peace advocate He was born at Orland, Me, and graduated in 1862 from Tufts College (A M, 1865) He founded, and was until his death head of, the firm of Ginn and Company, among the leading publishers of school and college textbooks in the United States, whose first book, Allen's *Latin Grammar*, was published in 1868 Long interested in social questions and in the world peace movement, in 1909 he set aside a million dollars to be used after his death to endow a World Peace Foundation In the meantime he contributed \$50,000 annually to carry on the work of the foundation, which was established in 1910 He also founded an International School of Peace in 1913 One of his public addresses was published under the title *Organizing the Peace Work* (1913)

GINNUNGAGAP, gin'nōōng-a-gap'. See BURI

GINSBURG, CHRISTIAN DAVID (1831-1914) An English biblical scholar He was born in Warsaw, Russian Poland, and was educated at the rabbinical school there, but went to England when he was a young man In 1857 he published *The Song of Songs*, with a valuable commentary and summary of previous criticism, and received an honorary LL D from Glasgow He wrote critical and historical commentaries on Ecclesiastes (*Cohleth*, 1861) and Leviticus (1882) and in 1870 was appointed one of the revisers of the Old Testament His great work was on the Masora—text (1880-86), Masoretico-critical edition of the Hebrew Bible (1894, 2d ed, 1911), and introduction (1897), also the Pentateuch (1908) and Isaiah (1909), revised after the Masora Among his other publications are *The Karates* (1862), *The Essenes* (1864), *The Kabbalah* (1865), *The Moabite Stone* (1870), with Salkinson, a Hebrew version of the New Testament, and a series of facsimiles of Hebrew manuscripts of the Old Testament (1897-98)

GINSENG, jin'sēng (Chin *jin-tsang*, likeness of a man, less probably, first of plants) The yellowish root of *Panax ginseng*, highly esteemed as a medicine by the Chinese, who believe that it possesses extraordinary virtues for all diseases, particularly for exhaustion of body and mind It was first referred to in English in 1654, in a translation of Martini's *History of the Conquest of China*, in which it is merely mentioned, but in De la Loubere's account of Siam in 1688 it is described as the most esteemed of all plants of the East The Tatars are said to drink a decoction of the leaves as tea In Siam the root was chewed in the same manner as coca is by the Peruvian Indians Loubere says "he that hath this root in his mouth will hold out at labor as long again as he that hath it not" Specimens resembling the human form are sometimes sold for their weight in gold This species, which is a native of China and adjoining territory, is from 1 to 2 feet tall, has five almost smooth leaves, with long petioles, between which arises the long-stalked umbel of inconspicuous flowers, which are succeeded by numerous scarlet berries It is cultivated in China and Korea A description of this species and its properties led to the discovery in 1716 of the American

species *Panax quinquefolium*, which so closely resembles Asiatic ginseng that an extensive export trade of wild roots soon followed its introduction in China Its natural range is from the borders of the Mississippi eastward, in the Southern States it is almost entirely confined to the highlands and the mountains The Northern root is considered of superior quality and commands the highest prices The decreasing supply of wild ginseng has been insufficient to meet the demand, and this led, in various localities, to many experiments in growing ginseng, all of which failed until about 1885, when George Stanton grew the plant in beds in the forest at Apulia, N Y He later succeeded in growing it under an artificial shade of lath Since the publishing of his methods interest in the plant has increased, and many beds have been set out The small quantities of cultivated root so far marketed have commanded 20 per cent or more in advance of the price paid for wild roots gathered in the same district Ginseng succeeds best in well-drained, loose, friable loam, rich in humus, potash, and phosphoric acid, but not in nitrogen In its present state of development the root requires about five years to reach marketable size Two fragrant aromatic species, *Panax fruticosus* and *Panax cochleatus*, natives of the Moluccas, are used in India as medicine In European and American practice none of these species are employed to any extent Consult Kains, *Ginseng* (New York, 1903), and Harding, *Ginseng and Other Medicinal Plants* (Columbus, Ohio, 1908)

GINTL, gin'tl, WILHELM FRIEDRICH (1843-1908) An Austrian chemist, a son of the physicist Julius Wilhelm Gintl He was born and educated in Vienna and was appointed professor of chemistry at the German Polytechnic Institute in Prague in 1870 From 1878 to 1889 he was a member of the Bohemian Diet In 1902 he entered the Austrian House of Peers He was the founder and first president of the Austrian Society for the Promotion of Chemical Industry He became widely known through his *Studien über Crookes strahlende Materie und die mechanische Theorie der Electricität* (1880)

GINZBERG, ASHER (pen name, AHAD HA-'AM) (1856-1927). A Russian scholar and founder of Zionism, born at Skvira, Kiev, Russia He studied the Talmud in a Jewish heder, or elementary school, and between 1882 and 1884 was at Vienna, Berlin, and Breslau Settling in Odessa in 1886, he founded in 1889 the Zionist League (Bene Mosheh) to improve Hebrew education, disseminate knowledge of Hebrew literature and culture, and care for the interests of the Palestinian Hebrew settlements In 1897 he attended the Zionist Congress at Basel, Switzerland, where he opposed the ideas of Dr Herzl, and from that time he became known as the leader of the "moral," as opposed to the "political," Zionism He inspected the Palestinian colonies in 1900 He became editor of *Keweret* in 1890 and of *Ha-Shiloah* in 1896 Ginzberg's writings in Hebrew came to be more widely read than those of any other contemporary author using the same language His articles were collected and published under the title *Al Parashat Derakim* (1895, 2d ed, 1902) Some of them were translated into German and Russian, and into English by Leon Simon under the title *Selected Essays* (1912)

GIOBERTI, jō-bār'tē, VINCENZO (1801-52).

GINKGO AND KENTUCKY COFFEE TREE

KENTUCKY COFFEE TREE (*Gymnocladus Canadensis*).

GINKGO TREE (*Ginkgo biloba*).

An Italian philosopher and statesman, born in Turin. Educated in the Church, he was ordained to the priesthood in 1825 and subsequently appointed professor of theology in the university of his native city. On the accession of Charles Albert he was selected as chaplain to the court, an office which he filled till 1833. In the rising political agitation Gioberti was accused of promoting the Liberal movement, dismissed from court, and suffered an imprisonment of four months. His name was stricken from the list of doctors of theology on the ground that through his teachings he was a corrupter of youth. He went to Paris and shortly after to Brussels, where he spent 11 years as private tutor in an academy, pursuing his studies in his leisure hours. Gioberti looked upon the papacy as the divinely appointed agency for the elevation of Italy among the nations. A confederation of states subject to papal arbitration, and having in the King of Piedmont a military protector, was his scheme for the unity and regeneration of Italy. These views he developed in *Del primato civile e morale degli Italiani* (1843). The liberal and conciliatory policy adopted by Rome on the accession of Pius IX, a warm admirer of the *Primato*, appeared as the verification of Gioberti's predictions and increased his popularity. On his return to Italy in 1848 he was received with ovations from all classes of the people and was chosen by several towns as their representative in Parliament. The King appointed him senator, he subsequently was elected President of the Chamber of Deputies, and in December, 1848, became Prime Minister, but, owing chiefly to the failure of his attempt to bring about an agreement between the Pope and the Grand Duke of Tuscany, he was forced to resign. His successor dispatched him to Paris on some unimportant mission, and thus ended Gioberti's political career, although his *Rinnovamento civile d'Italia* (1851) was the Bible of the revolution of 1859.

From that period he devoted himself exclusively to literary pursuits in Paris until his death. Gioberti aimed at the glory and aggrandizement of his country by means of the awakening of the national consciousness, but failed in farsightedness, and his influence as a political guide declined, but the depth of thought and strength of conviction in his various works entitle him to the standing which, as a writer, he enjoys. Gioberti's remarkable gentleness in private intercourse bore no trace of the energetic force with which his writings propound an opinion or denounce an opponent. His chief writings, besides the *Primato*, are *La teoria del soprannaturale* (1838), *L'Introduzione allo studio della filosofia* (1840), which sums up his philosophical system, best stated in the proposition, "Being creates existence", the *Lettre sur les doctrines philosophiques et politiques de M. de Lamennais* (1841), the treatises *Del bello* (1841) and *Del buono* (1843), the *Prolegomeni al Primato* (1845), an open attack upon the Jesuits, whom he had covertly assailed in the *Primato*; *Il Gesuita moderno* (1847), a second attack upon the Jesuits, who had replied to his *Prolegomeni*, *Del rinnovamento civile d'Italia* (1851), advocating unity of the Italian states, national independence, and suppression of the temporal power of the Pope. There appeared (1855-63) the *Riforma cattolica della Chiesa*, the *Filosofia della rivelazione*, a large part of

his correspondence, and several other works. Consult Bertì, *Di Vincenzo Gioberti, riformatore politico e ministro* (Florence, 1881), Spaventa, *La filosofia di Gioberti* (Naples, 1863), Mauri, *Scritti biografici* (Florence, 1876), Zanichelli, "La giovinezza di Vincenzo Gioberti," in *Studi politici, etc.* (Bologna, 1893). His whole philosophy is presented in extracts, organically arranged, in *V. Gioberti, Nuova protologia*, ed by G. Gentile, 2 vols (Bari, 1912).

GIOBERTINE (jō-bēr'tin) **TINCTURE** A preparation for restoring writings or paintings which have from age become illegible. In some cases the process has recovered documents which have been partially expunged and the parchment written over. (See PALIMPSEST.) The inventor of it was Giovanni Antonio Gioberti, an Italian chemist (1761-1834), a native of Piedmont, secretary of the Society of Agriculture at Turin, and professor in the university in that city.

GIOCONDA, jō-kōn'da, LA. An opera by Ponchielli (q.v.), first produced in Milan, April 8, 1876, in the United States, Dec 20, 1883 (New York).

GIOCONDO, jō-kōn'dō, FRA GIOVANNI (c 1450-1515). An Italian architect, engineer, and antiquary, born at Verona. He was a Franciscan friar, studied archaeology in Rome, and made a remarkable collection of some 2000 ancient inscriptions which he presented to Lorenzo de' Medici. He was the designer of the fortifications of Treviso and of works to prevent the silting up of the lagoon of Venice. He was architect of Ferdinand, King of Naples (1489), and when Naples was taken by the French in 1495 he went with Charles VIII to France, where he is said to have designed the Pont Notre Dame, the Hôtel Dieu, Chambre des Comptes (neither of these two now standing), and other works. After his return to Italy the Pope appointed him (1513) architect of St Peter's, he succeeded Bramante and was a collaborer with Raphael and Giuliano da San Gallo. He is generally and with good reason believed to have designed the elegant Palazzo del Consiglio at Verona, erected most probably from his designs during his absence in France and considerably altered in modern times. He was proficient in philosophy, theology, and classical literature, wrote notes on Caesar's *Commentaries*, and published a critical edition of Vitruvius (1511).

GIOIA DEL COLLE, jō'ya dēl kōl'lā. A city in the Province of Bari delle Puglie, south Italy, 38 miles northwest of Taranto (Map Italy, F 4). It has a fine twelfth-century castle, built by the Hohenstaufen and recently restored. It markets grain, wine, almonds, and wool. In May and September important cattle fairs are held there. Pop (commune), 1901, 21,721, 1911, 21,837.

GIOIOSA JONICA, jō-yō'sa yō'nē-ka. A city in the Province of Reggio di Calabria, south Italy, 10 miles northeast of Gerace, near the Ionian Sea. Three miles below the town are the ruins of a Roman theatre and another ancient building called the Naviglio, whose nature and purpose are not clear. (See *Notizie degli scavi*, 1883-84.) It markets grain and olives. Pop (commune), 1901, 10,247, 1911, 10,943.

GIOJA, jō'ya, FLAVIO. An Italian navigator of the fourteenth century, born at Pasticcio, near Amalfi. Three centuries later a legend—the elements of which can be analyzed—took form that he invented the compass, but he

merely contributed to perfect the instrument and to make it available for navigation. Possibly he chose the fleur-de-lis to mark North on the compass card, in honor of Charles of Anjou.

GIOJA, MELCHIORRE (1767-1829). A famous Italian publicist, born at Piacenza. He was educated for the priesthood, but later studied at Pavia, withdrew from the clergy, and in 1799 was appointed by the French government director of the statistical bureau at Milan. Some of his chief works are *Sul commercio dei commestibili e care prezzo del vitto* (1804), *Nuovo prospetto delle scienze economica, Filosofia della statistica*.

GIOJELLI DELLA MADONNA, jō-yē'lē dell'a ma-dōn'na, I It. The Jewels of the Madonna. An opera by Wolf-Ferrari (qv), first produced in Berlin, Dec. 23, 1911, in the United States, Jan. 16, 1912 (Chicago).

GIOLITTI, jō-lēt'te, GIOVANNI (1843-) An Italian statesman. He was born at Mondovì in the Province of Cuneo and was educated at Turin. After serving for eight years in a department of the Ministry of Finance, in which he was appointed chief inspector in 1874, he was elected to the Chamber of Deputies. In 1889 he became Minister of the Treasury and, in the following year, Minister of Finance, which position he was soon afterward compelled to resign because of his policy of extreme economy. After the fall of Rudini, whose financial policy he had stoutly opposed, Giolitti became President of the Ministry, in May, 1892, and, although constantly antagonized by the Chamber, succeeded in introducing many needed reforms in favor of the lower classes. In November, 1893, he was compelled to resign on account of the bank scandals and particularly on account of his friendly relations with Tanlongo, director of the Banca Romana, who had issued duplicate notes, had corrupted government officials, and whom Giolitti had appointed to the Senate. Giolitti became Minister of the Interior in 1901, resigned in June, 1903, and in October formed a ministry of his own. He resigned in March, 1905, but became Premier again in May, 1906, and held office until December, 1909. Sonnino's cabinet, which succeeded, resigned in March, 1911, and Giolitti again came into office, apparently only the stronger for his many defeats. After his colonial budget had been vetoed in 1914 (March 4), he resigned (March 8), partly it seemed for strategic reasons.

GIORDANI, jōr-da'nē, PIETRO (1774-1848). An Italian author, born at Piacenza, a stylist, and one of the several writers who helped the Italian language to throw off the French bondage of the preceding period. He studied law, but in a moment of romantic despair joined the Benedictine Order. After Marengo he fled from the cloister and finally became secretary of the Academy at Bologna. His *Panegirico a Napoleone* caused him to be deprived of this post, at the restoration, in 1815, of the papal government. The authority at Vienna, displeased by the liberality of the views he frankly expressed, persecuted him to the end of his life, throughout which he displayed a fine spirit of patriotism. His writings are numerous, consisting largely of critical essays, eulogies, memorial addresses, and pamphlets, and form part of the best Italian prose. He was the first to recognize the genius of Leopardi. Giusti, Manzoni, Monti, Canova, and Capponi were also his

friends. The most valuable of his writings is the *Epistolario*, published with the *Opere*, ed. by Gussalli and Vassalli (4 vols., Milan, 1854-62). Consult Romani, *Della vita e delle opere di Pietro Giordani* (Mantua, 1868), and Della Giovanna, *Pietro Giordani e la sua dittatura letteraria* (Milan, 1882).

GIORDANO, jōr-da'nō, LUCA, called LUCA FA-PRESTO (1632-1705). An Italian painter, born in Naples. He was the son of Antonio, an inferior painter, who continually urged him on at his work, saying, "Luca, work quickly," whence his nickname, "Fa-Presto." He painted with such facility that at the age of 13 the Viceroy of Naples placed him under the instruction of Giuseppe Ribera. When still young, he went to Rome, where he made many copies of the pictures by the great masters. There he studied under Pietro da Cortona, whom he assisted in his numerous contracts. He afterward visited Venice and studied Titian and Paul Veronese, later, on his return to Naples, he was fitted to undertake important work. Throughout his life he never lacked patronage. In 1678 he executed an immense picture to commemorate the peace between France, Spain, and Holland. In 1679 he was invited to Florence by the Grand Duke Cosimo III to decorate with frescoes the cupola of the Cosimi Chapel, and in 1683 the Galleria Rocardi with a fresco of Olympus. In 1690 he was invited to Spain by Charles II and appointed painter to the King and made Knight. He painted some of his best frescoes in the chapel of San Lorenzo and on the grand staircase of the Escorial, the latter represented "The Battle of Saint-Quentin" and "The Taking of Montmorency." He also decorated other churches and palaces at Madrid and Toledo. After the death of Charles II Giordano continued in the service of Philip V, and in 1702 he accompanied that monarch to Naples and was received with great enthusiasm. So great had now become his power of painting rapidly that it is said he painted for the Jesuits a picture of "St. Francis Xavier Baptizing the Indians," now in the Museum of Naples, in a day and a half. In like manner he completed in 48 hours the frescoes of the Tesoro di San Martino, Naples, representing the "Story of Judith." One of his best frescoes is the "Cleansing of the Temple," in San Philipppo a Girolamini, Naples.

He painted an incredible number of pictures, all the chief galleries of Europe are well supplied with them. Madrid has a great number, and there are many others at Dresden, Vienna, Naples, and Munich. His earliest works are in the manner of Ribera, but by far the greater number are in a style formed under Pietro da Cortona. He possessed ready invention and charm. His color is harmonious and his brushwork good, but his pictures were negligently executed. Among his best works, besides those mentioned above, are "Venus and Mars," in the Louvre, the "Judgment of Paris," in Berlin, "David with the Head of Goliath" and "Lot and his Daughters," at Dresden, "Massacre of the Innocents," Munich, "The Archangel Michael," Vienna, etc. Consult Bellori, *Le vite de pittori, scultori, ed architetti moderni* (Rome, 1728), and Riccardi-Vernaccia, *Galleria Riccardiana* (Florence, 1828).

GIORDANO, UMBERTO (1867-) An Italian composer, born at Foggia. He received his musical education at the Conservatory of

Naples under Serrao, and while still a student attracted the attention of the publisher Sonzogno, who commissioned him to write his first opera, *Mala Vita* (1892). In 1894 *Regina Diaz* followed and failed, but two years later the success of *Andrea Chénier* carried the composer's fame beyond Italy. *Fedora* in 1898 almost duplicated the success of its predecessor, while *Siberia* (1904) showed a decided falling off. After a somewhat long period of silence he wrote *Mese Mariano* (1913), which shows a general advance over his preceding works, but still fell short of the great success of *Andrea Chénier*. His latest opera, *Madame Sans Gêne*, had its world's première at the Metropolitan Opera House, New York, in 1915. Giordano began as an outright imitator of Mascagni, but soon turned away from the coarseness and brutality of the "veristic" school. He combines real melodic invention with strong dramatic instinct.

GIORGIO, jôr'jô, FRANCESCO DI (1439-1502). An Italian architect, engineer, sculptor, and painter, remarkable for his versatility, which makes him prominent among the artists of the Renaissance. He was born in Siena, where, after 1463, he did constructive work, especially in connection with fortifications. From 1478 he was in the service of the Duke of Urbino as military architect and engineer. In 1480 he was commissioned to construct the model for the dome of the cathedral at Milan, executed in 1493 by Giovanni Antonio de Gessato. The invention of mines at the siege of Naples in 1495 is attributed to him. As a sculptor, he may be judged by the figures in the Loggia dei Nobili, and the angels bearing candelabra in the cathedral at Siena. In painting he was a pupil of Vecchietta, and imitated Fra Filippo Lippi, to which his graceful pictures in the Siena Gallery bear witness. He wrote a *Trattato di architettura civile e militare*, ed. by Cesare Saluzzo in 1841.

GIORGIONE, jôr-jô'nâ (c. 1478-1510). One of the greatest Venetian painters, the pioneer of the High Renaissance in Venice. Giorgione is the strong form of Giorgio, Venetian Zorzon (Zorzo, Zorzi), by which name he is known in contemporary documents. He was born at Castelfranco, near Treviso. There is no warrant for the seventeenth-century tradition of his descent from a local noble family, the Barbarelli. Of his life little is known besides what Vasari relates that he was of humble origin and was brought up in Venice, that he was beautiful in person and of great social charm, a fine musician, singing perfectly to the lute, that he was an ardent lover, a typical representative of the gracious Venetian life of his day. Although Vasari's narrative is based on later tradition, the picture which he presents is confirmed by the few other surviving sources. The influence of his boyhood home may be seen in the idyllic landscape of his pictures. He came early to Venice and was apprenticed to Giovanni Bellini (qv). Success came to him early, for in 1500 he received commissions from the Venetian state for the portraits of Doge Agostino Barbarigo and Condottiere Consalvo Ferraioni. In 1504 he was commissioned by Tuzio Costanzi, another condottiere, to paint the great altarpiece at Castelfranco, in 1507 he was employed in painting a large easel picture for the Hall of Audience in the Ducal Palace, and in 1507-08, in company with other artists, he decorated the façade of the Fondaco dei

Tedeschi, after having previously decorated some half dozen others. In September or October, 1510, he died of the plague in Venice.

In such a short life he could have executed but few of the 150 paintings formerly attributed to him in the European galleries. Of unquestioned authenticity, supported by documentary evidence, are the three following paintings: (1) the altarpiece of the cathedral of Castelfranco, a "Madonna Enthroned between Saints Liberale and Francis," one of his earliest works, (2) "Gypsy and Soldier" (Venice, Palazzo Giovanelli), a beautiful landscape containing idealistic figures of a young man meeting a nude woman and child, (3) "Evander Showing Æneas the Site of Rome" (Vienna Museum).

Critics are, for the most part, agreed in ascribing to his early period two small richly colored pictures in the Uffizi, Florence—"Moses and the Burning Bush" and "The Judgment of Solomon," both of his early period, and besides the "Madonna with Saints Anthony and Roch," catalogued as a Pordenone, in the Madrid Gallery. Of a later period is the "Fête Champêtre," in the Louvre. Of the many portraits ascribed to him, the "Knight of Malta," in the Uffizi, and the "Man in a White Costume," at Rovigo, are certainly genuine, the admirable "Young Man," in the Berlin Museum, and "Antonio Brocardo," in the gallery at Budapest, are probably also genuine.

Among other works rightly ascribed to Giorgione are "Christ Bearing the Cross," now in the Gardner collection, Boston, and an earlier version in San Rocco, Venice, "Apollo and Daphne," in the Archbishop's Seminary, Venice, the "Three Ages of Man," in the Pitti Palace, Florence, and, especially, the "Sleeping Venus," in the Dresden Gallery, formerly considered a copy from Titian. This last picture is, in our opinion, the most perfect representation of Venus in the art of the Italian Renaissance, and is the prototype of other representations of this subject by Venetian artists. Morelli was the first to ascribe it to Giorgione, but he rejects the "Concert," in the Pitti Palace, usually ascribed to him, although it is a picture of the greatest charm. Many other pictures are attributed to Giorgione in European galleries, and especially in the English, but most of these are doubtful. The most charming of these is the "Shepherd Boy," in Hampton Court, which seems more likely the work of Torbido.

Vasari long ago pointed out that Giorgione's position in Venetian painting was like that of Leonardo in Florentine, for he conducted it from the constraint and the detail of the early, to the freedom and mastery of the high, Renaissance. Through him the new worldly spirit entered into Venetian painting. Once religious and didactic, it now became worldly and poetic—an expression of the happy, gracious, and complete Venetian life of his day. Under the guise of religious subjects he painted real genre, Venetian men and women in beautiful sunny landscapes, with no particular religious significance, but merely to express the mood or sentiment of the painter. He made remarkable progress in the landscape, which he treats as of equal importance with the figures represented—idyllic in character and with the most remarkable effects of sunshine and atmosphere hitherto attained. The color in his painting is bright, soft, and wondrously melting, the tone is golden, the light and shade subtle, and the line, though

not so distinct as Titian's is nevertheless correct. His was unquestionably the most powerful influence upon Venetian painting in the sixteenth century. Practically all important contemporaries followed his lead, even his master, the aged Bellini. Among those most directly under his influence were Titian, Sebastian del Piombo, Palma Vecchio, Pordenone, Torbido, and Cariani.

Bibliography The earliest authority to classify the works of Giorgione on a sound critical basis was Morelli (*Italian Painters*, London, 1892). Since then much progress has been made by Berenson, whose attributions seem to the present writer the soundest (*Venetian Painters of the Renaissance*, New York, 1909), by Justi, *Giorgione* (Leipzig, 1908), and Venturi, *Giorgione e il Giorgionismo* (Milan, 1913). The two last-named monographs publish also the historical sources of his life and works and contain excellent reproductions. Other interesting monographs are Conti, *Giorgione* (Milan, 1894), Gronau, *Zorzon da Castelfranco* (Venice, 1894), Cook, *Giorgione* (London, 1900), Von Boehn, *Giorgione und Palma Vecchio* (Bielefeld, 1908).

GIOTTINO, jōt-tē'no (c 1324-57) An Italian painter, of the school of Giotto. Much confusion exists concerning the painter designated under this name by Vasari. It is thought by modern critics that the works of two different men—Maso, a pupil of Giotto, who worked before 1350, and Giotto di Stefano, who was active in the later fourteenth century—have been confounded under the name "Giottino." A Deposition, in the Uffizi, a "Crucifixion" and "Adoration," in the Strozzi Chapel at Santa Maria Novella, the legend of Constantine and Pope Sylvester at Santa Croce in Florence, are attributed to Giottino. So have also been the frescoes of the Life of St. Nicolas in the lower church at Assisi, and those in the church of Santa Chiara, Assisi. The last two, however, are probably by Giotto di Stefano. He stands very close to Giotto, had strong realistic tendencies, and partly gained in delicacy what he lost in force and originality. Consult Vasari, *Lives of the Painters* (10 vols., New York, 1912), Crowe and Cavalcaselle, *History of Painting in Italy*, vol. 1 (London, 1903), Thode, *Franz von Assisi* (Berlin, 1885), Siren, *Giottino und seine Stellung in der gleichzeitigen florentinischen Malerei* (Leipzig, 1908).

GIOTTO, jōt'tō (GIOTTO DI BONDONE) (c 1276-1337) A Florentine painter, the greatest of Italy before the Renaissance, also a sculptor and architect. He was born at Colle, near Vespignano, the son of a landed proprietor—not of a peasant, as was formerly supposed. Two different legends explain his early study of painting. Vasari, following Ghiberti's *Commentaries*, relates that while a shepherd boy he was seen by Cimabue (qv) drawing sheep on a slate, a commentator of Dante says that while apprenticed to a wool merchant he became attracted to Cimabue's studio and then entered it as this master's pupil (c 1280). But even the fact of his connection with Cimabue is now strongly contradicted. It has become evident that his style is different from Cimabue's—which was a combination of the Byzantine and Roman schools—and that he was the pupil of the Roman school, developing its early Christian and classic side, and having close relation with his older contemporary, Pietro Cavallini (qv).

He was influenced by the naturalistic art of Giovanni Pisano. See PISANO.

GiOTTO's earliest works are at Assisi, in the church of St. Francis, where several stages in his early progress may be traced, from his intense and revolutionary but juvenile work depicting the life of St. Francis, in the upper church, through the series of the "Life of Christ," in the lower church, completed in 1297 or 1298, to the masterly "Allegories of St. Francis." Returned to Rome in 1298, Giotto painted the altarpiece for St. Peter's (now in the sacristy), and designed the "Navicella" in mosaic, still surviving, much restored, in the vestibule of St. Peter's, the frescoes on San John Lateran of which a fragment, "Boniface VIII Proclaiming the Jubilee," still survives. At this time he is supposed to have painted the frescoes in the Palazzo del Podestà (now Museo Nazionale), Florence, from which, in 1841, the whitewash was partially removed, and which were thereupon ruinously "restored." They have attracted wide attention because in one of them the portrait of Dante appears between Corso Donati and Brunetto Latini. (For illustration, see DANTE.) Giotto's authorship, however, has been denied with great show of reason.

The next stage in his career is marked by the decoration in fresco of the entire Arena Chapel at Padua in 1303, in three rows of compositions illustrating the "Life of Christ," and the "Life of the Virgin," in 38 scenes, besides the "Last Judgment" on the inner façade, the scenes in the choir, and the "Allegories" of the dado. The simplicity, dignity, and dramatic power of these compositions are beyond praise. He reaches here the height of his genius. After executing some almost destroyed works in Sant'Antonio, Giotto returned to Florence and then to Assisi, where he painted the four famous allegorical frescoes in the vault of the lower church—the "Marriage of St. Francis with Poverty," the "Triumph of Charity," the "Triumph of Obedience," and the "Glorification of St. Francis." At some time before 1330 he executed the superb series of frescoes in the chapels at Santa Croce, of which only those in the Bardi and Peruzzi chapels survive in lamentable condition, but sufficiently to show that the religious fever recently gained had not been lost.

The "Life of John the Evangelist" and the "Life of John the Baptist" (cleaned in 1841 and 1863) in the Peruzzi Chapel, representing his maturest style, are pronounced by many to be the master's greatest work, and the most fruitful inspiration of his successors even during the fifteenth century. The "Ascension of St. John" also is remarkable, as are the "Dance of Herodias' Daughter" and the "Birth of John the Baptist." The scenes in the Bardi Chapel are from the "Life of St. Francis," from which even Ghirlandajo and Benedetto da Maiano drew inspiration. On the invitation of King Robert of Naples, Giotto went to that city in 1330. He was named member of the King's household and assigned important commissions in the Castel Nuovo and Castel del Uovo and Santa Chiara, but no trace of these works survives. During his stay, which lasted at least till 1332, he established a branch of his school. After his return to Florence he was engaged rather in works of architecture and sculpture than painting.

While Giotto's genius undoubtedly expressed itself in freest and most revolutionary fashion

GIORGIONE

"THE CONCERT," FROM THE PAINTING IN THE PITTI PALACE, FLORENCE

in frescoes, his panel pictures are both numerous and important. An early example is the "Virgin and Child Enthroned, with Angels" in the Academy at Florence. There are crucifixes at Santa Maria Novella, at the Ognissanti, and the Arena Chapel, Padua, important altarpieces at Santa Croce (Florence), in the gallery at Bologna, in the Louvre, a "Last Supper" in Munich, and a "Presentation of Christ in the Temple" in the Gardner collection, Boston.

Giotto was also an architect, though probably not of the first rank, except as a designer. He was made chief architect of the Florentine Cathedral in 1334, and his masterpiece of design, the Campanile, called Giotto's Tower, was then begun, and though left unfinished at his death, was probably carried out according to his plan, at least in the lower stories. A design preserved in the Opera del Duomo at Siena may possibly be the original one by Giotto. In it the lower story corresponds exactly with that of the Campanile, while the crowning spire harmonizes with what Vasari tells us was Giotto's original plan. The Campanile is unique among church towers for its wealth of colored patterns and architectural detail and especially of sculptures. It is a square tower, 84 meters high, in three stories. Its reliefs and statues were from his designs, executed partly by Andrea Pisano and other masters, and are among the best works of Italian Gothic sculpture. They are characteristic, allegorical, and philosophic themes of the creation and the moral qualities of man, and the various occupations of human life, artistic, scientific, intellectual, and material. Giotto's share in the building of the cathedral is less clear.

Giotto was from the first a popular figure in Florentine story. His praises were sung by his friend Dante and by Petrarch, the historian Villani eulogizes him, while Boccaccio and Sacchetti relate interesting anecdotes. From these accounts he seems to have been a typical Florentine, able, clever, and witty to an unusual degree. His ode on "Poverty," which has been preserved, presents a striking contrast to his ideal representation of the subject in his paintings. In painting his style was broad and simple, his coloring light and clear, his figures animated and full of expression, in contrast to the previous Byzantine style. At his death his style had penetrated through a large part of Italy, and his followers gave him the compliment of almost slavish imitation. The Giottoesque style ruled Italy throughout the fourteenth century as no one man's style ever did before or afterward.

Bibliography. The original sources are Ghiberti, *I commentari*, ed Schlosser (Berlin, 1914), Vasari, *Lives of the Painters* (10 vols, New York, 1912), Boccaccio, *Decameron*, vol vi, 5, Sacchetti, *Novelle* (Florence, 1886). GIOVANITTI, jô'va-nê't'îc, ARTURO M (1884-) An American industrial agitator, born in the Abruzzi, Italy. He emigrated to the United States in 1901, studied in Union Theological Seminary, New York City, and worked in Presbyterian missions. With Joseph J. Ettor (qv) he led the Lawrence (Mass.) textile mill strikers in 1912. The authorities of Lawrence had these two leaders arrested in January upon the charge of inciting to a riot leading to loss of life, they based their action upon a statute fallen into desuetude. Ettor and Giovanitti were kept in jail for more than 10 months before they were at last tried and acquitted in November, 1912. Their imprisonment occasioned a nationwide agitation for free speech by the Industrial Workers of the World, the Socialists, and other more or less radical elements, and at the time of the trial a 24-hour protest strike was called in Lawrence. "The Cage," a poem by Giovanitti published in the *Atlantic Monthly*, was inspired by the idea of "sixteenth-century courts trying to solve twentieth-century problems." A volume of his verse, *Arrows in the Gale*, was published in 1914.

GIOVENAZZO, DUKE OF See CELLAMARE.

GIOVINAZZO, jô've-nat'sô. A city on the Adriatic, in the Province of Bari delle Pughe, Italy, 12 miles northwest of the city of Bari. It has bastioned walls, a thirteenth-century Greek-Norman cathedral, a theatre, a technical school, and a gymnasium. It markets wine, olives, almonds, and building stone, and manufactures brandy and fish nets. Pop (commune), 1901, 11,245, 1911, 10,727.

GIOVIO, jô've-ô, PAOLO, also known by the Latin form of his name, JOVIVS (1483-1552). A noted Italian biographer and historian. He was born at Como and studied philosophy and medicine at Padua and at Pavia, but finally turned to literature, after practicing medicine at Rome. His excellent Latin style brought him to the notice of Leo X, who in turn recommended him to the kindness of Cardinal Giulio de' Medici, afterward Clement VII. Clement showered favors on him and as a compensation for the loss of all his property, incurred in the sack of Rome, 1527, made him, in 1528, Bishop of Nocera in Naples. Clement's successor, Paul III, looked with disfavor on the worldly, pleasure-loving Bishop, and Giovio was compelled to retire to his magnificent villa on Lake Como, where he spent his time in the company of fine pictures and clever men. He was a contemporary of Machiavelli and Varchi. He frequently visited, however, the various Italian courts, where his genius and esprit were greatly admired. He died at Florence, of the gout, and was buried in the church of San Lorenzo. Giovio was an excellent type of the ecclesiastical pagan of the Italian Renaissance. As an historian, he is not to be depended on, being exceedingly incorrect in his facts and shamelessly venal. The following works, however, deserve mention: *Historiarum sui Temporis Libri XLV* (Florence, 1550-52), *Illustrum*

Vivorum Vitæ (ib, 1549-57) Consult Muntz, *Le musée de portraits de Paul Jove* (Paris, 1901)

GIPPSLAND, gîps'lând The southeast district of Victoria (q v), Australia. It is composed largely of mountain and forest land with great mineral deposits. Its valleys are fertile.

GIPSIES See GYPSIES

GIRAFFE, jî-râf' (formerly also *jaraff*, from Fr *giraffe*, from Sp, Portug *girafa*, from Ar *zarâfat*, giraffe, from *zerafa*, to walk slowly), or CAMELOPARD The tallest of quadrupeds (*Giraffa camelopardalis*), constituting, with the okapi, a distinct family of ruminants, Giraffidæ. It is a native of Africa, formerly extensively diffused from Nubia to the Cape of Good Hope, though apparently nowhere abundant. It is now nearly extinct south of the Zambezi River and east of the Kalahari Desert, and numerous only in the remote interior, where it frequents arid plains. It occurs generally in small herds of from 5 to 40 and feeds on the leaves and small branches of trees. Its general aspect is remarkable because of the height of the fore parts and great elongation of the neck, the head being sometimes 18 feet from the ground. The number of vertebrae in the neck is seven, no greater than in other quadrupeds, and the neck has no extraordinary flexibility, but its length is produced by an elongation, elsewhere unknown, of each vertebra. The body is short, and the back slopes from the shoulder to the tail, but the greater height of the fore parts is not owing to the length of the forelegs, which are not really longer than the hind legs, but to processes of the vertebrae which form a basis for the muscular support of the neck and head and make a hump on the shoulders. The articulation of the skull to the neck is such that the head can easily be thrown back until it is in the same line with the neck, thus giving the animal additional power of reaching its appropriate food. The skull has empty cavities, which give lightness to the head, along with sufficient extent of surface for the insertion of the ligament which supports it. The legs are long and slender, the feet have cloven hoofs, but are destitute of small lateral toes. The head is long, the upper lip entire, projecting far beyond the nostrils, and endowed with considerable muscular power. The tongue is remarkably capable of elongation and can be thrust far out of the mouth and employed to grasp and take up very small objects, and by it and the mobile lips the animal obtains its food, which consists almost wholly of the leaves and twigs of mimosa trees. The dentition of the giraffe is bovine, but the upper jaw has no canine teeth. The head is furnished with two remarkable protuberances between the ears, generally described as "horns," and consisting of a bone united to the skull by an obvious suture, permanent, covered with skin and hair, and terminated by long hard bristles. The nearest analogue is the horn core of the pronghorn. The ears are moderately long, the tail is long and terminates in a tuft of long hair that nearly reaches the ground. There is a callosity on the breast. The neck has a very short mane. The hair is short and smooth, reddish white, marked by numerous dark rusty spots.

The eye of the giraffe is very large, lustrous, and commands a wide angle of vision, and the nostrils have a muscle by which they can be closed against blowing sand. It is an inoffen-

sive animal and generally seeks safety in immediate flight, although it is capable of making a stout resistance, and fights by kicking with its hind legs, discharging a storm of kicks with extraordinary rapidity. It is not easily overtaken even by a fleet horse and has greatly the advantage of a horse on uneven and broken ground. Its pace is a gallop, the hind legs reaching ahead and astride of the forefeet at every leap. Wise hunters who attempt to pursue giraffes at all on horseback try to push them so hard at first as to get them "blown," after which they can drive them steadily towards camp, otherwise the giraffe may gallop for miles. They are exceedingly keen of smell and hearing, see well, and are game that tax the skill of good sportsmen, yet great numbers have recently been killed for their hides.

The giraffe was known to the ancients and was exhibited in Roman spectacles. Representations of it appear among Egyptian antiquities. It has been supposed to be the *zemer* of the Jews, translated *chamos* in the English Bible (Deut xiv 5). Giraffes are among the rarest and most valuable animals in captivity, although they will thrive well with proper care. In 1892 the last giraffe in the gardens of the London Zoological Society died, and for the first time since 1836 the animal was not on exhibition in London, the secretary of the society reported that he saw no immediate prospect of obtaining a living specimen. They have bred in Europe.

Besides the typical form, a dozen or more subspecies have been recognized, while the Somali giraffe, *Giraffa reticulata*, is usually considered a distinct species.

Fossil Forms The modern giraffe is the lone relic of the family Giraffidæ that was rather widely distributed during later Tertiary times. The origin of the family is not known, though it seems to have split from the other ungulates at a late date and to be closely allied to the deers and oxen. Fragmentary skeletons like that of the modern giraffe, perhaps of the same species, are found in the Pliocene deposits of Europe and India. The earliest forms, found in the Pliocene beds of India, Persia, and southern Europe, have more heavily built skeletons, with shorter necks and larger horns, than does the modern species, and the horns, of which there are often two pairs, are found on the skull of the male only. The principal fossil genera are *Samotherium* and *Svatherium* (qq v).

The best accounts of giraffes are found in the writings of African sportsmen travelers, such as the books of Sir W C Harris, Gordon Cumming, C J Andersson, Sir Samuel Baker, H A Bryden, and especially of H C Selous. For a recent review of the known forms, consult Lydekker, *Game Animals of Africa* (London, 1908), and Rothschild and Neuville, *Annales des Sciences Naturelles Zoologie*, (9) xiii (Paris, 1911). Consult also authorities mentioned under ANTELOPE, so far as they relate to Africa, and see Plate of GIRAFFE and OKAPI.

GIRALDA, Hê-ra'l'da (from Sp *gvar*, to turn) A square tower, now serving as the belfry of the cathedral of Seville, Spain, built between 1184 and 1196 as a minaret of a mosque. By some authorities its design is attributed to the Arab mathematician El Guebr. The tower measures 50 feet at its base and tapers slightly towards the top of the square portion,

GIRAFFE AND OKAPI

1. GIRAFFE (*Giraffa camelopardalis*)

2. OKAPI (*Okapia johnstoni*)

250 feet above, which is reached by an inclined plane without stairs. It is richly decorated in Moorish style. From this top rises a square Renaissance belfry, 100 feet in height, dating from 1568, terminating in a small dome. The latter is surmounted by a statue of Faith, which in spite of its great weight is adjusted to turn freely with the wind and gives the tower its name. Consult J. A. Cean Bermúdez *Descripción artística de la catedral de Sevilla* (Sevilla, 1863), and G. E. Street, *Gothic Architecture in Spain* (2 vols., New York, 1914). See Plate of SEVILLE.

GIRALDÈS, zhé'ra'l'das', CARDOZO JOACHIM ALBIN (1808-75). A French surgeon, born at Oporto, Portugal, and educated in Paris. He was for many years surgeon of the Foundlings' Hospital, Paris, and (1848-54) surgeon of the Central Bureau of Hospitals. An accident compelled him to give up active practice. One of the constituent parts of the human testicle bears his name. His contributions to medical science include *Des luxations de la mâchoire* (1844), *Du traitement des aneurysmes poplités par la compression* (1845), *Recherches sur les kystes muqueux du sinus maxillaire* (2d ed., 1860), *Leçons cliniques sur les maladies chirurgicales des enfants* (1869).

GIRALDI, jé-ra'l'dé, GIOVANNI BATTISTA, surnamed CINZIO, or CYNTHIUS (1504-73). An Italian author, born at Ferrara. He was educated at the university there, where in 1525 he was made professor of natural philosophy. He became Secretary of State under the dukes Ercole d'Este II and Alfonso II of Ferrara. As a member of the Accademia delle Affidati, he took the name of Cinzio. He wrote a number of tragedies, the best known of which is *Il Orbecche* (1541), and *Gli hecatommisti* (1565), a hundred tales, translated into French as *Les cents excellentes nouvelles* (1583) by G. Chappuy. The plots of Shakespeare's *Measure for Measure* and *Othello* can be traced to him. His plays show the influence of Aristotle and Seneca, but he applied their theories with great freedom. Consult Bilancini, *Giraldi e la tragedia ital nel secolo XVI* (Aquila, 1890), Ghilini, *Teatro d'uomini letterati*, vol. 1, F. Beneducci, *Il Giraldi e l'epica nel cinquecento* (Bra, 1896).

GIRALDUS, or **GERALD, DE BAR'RI** (?1146-?1220). An English ecclesiastic and chronicler, best known as Giraldus Cambrensis. He was born in Pembrokeshire of a noble Norman family and was educated by his uncle, who was Bishop of St David's. During his youth he thrice visited Paris, studying and lecturing at the university there. He took holy orders, probably in 1172, and was soon afterward appointed Archdeacon of Brecknock, in which capacity he showed himself an ardent champion of ecclesiastical privilege and a strict disciplinarian. On the death of his uncle, in 1176, Giraldus was chosen Bishop by the chapter of St David's, but failed of confirmation by the King and retired to the University of Paris, where he resumed the study of canon law and theology. He returned to England in 1180, and in 1184 he visited Ireland as preceptor to John, the youngest son of Henry II. As a result of this trip, he wrote his *Expugnatio Hibernica* and *Topographia Hibernica*, a description of Ireland, which still possesses great antiquarian value, though open to criticism in many respects. A tour of Wales which he made in 1188 in the company of Baldwin, Archbishop

of Canterbury, resulted in the writing of the *Itinerarium Cambriae*. About this time Giraldus was offered the bishoprics of Llandaff and Bangor, but refused to accept either, in expectation probably of succeeding to the see of St David's, on which his heart was set. In 1198 that office fell vacant, and Giraldus was again elected by the chapter, but only to be rejected again by the King, the chief reason for his failure being, perhaps, his Welsh family connections. After a contest lasting five years and repeated appeals to the Pope, Giraldus accepted defeat, resigned his office of archdeacon, and devoted himself henceforth to study. Giraldus' writings, though disfigured by credulity and marked, in the personal narratives with which they abound, by excessive vanity, are of great value as materials for the political history and the social condition of the age and the country which they describe. His works are in the *Rolls Series* (8 vols., 1861-91)—vols. 1-iv by Brewer, vols. v-vii by D. M. M., vol. viii by Warner. The *Topographia Hibernica*, *Expugnatio Hibernica*, *Itinerarium Cambriae*, and *Descriptio Cambriae* are published in one volume in "Bohn's Antiquarian Library." Consult Hoare's translation of the *Itinerary through Wales* (2 vols., London, 1806), Owen, *Gerald the Welshman* (1b, 1889), Gross, *Sources and Literature of English History* (1b, 1900).

GIRANDOLA, jé-ran'dó-la. A splendid display of fireworks formerly given at the castle of Sant' Angelo, Rome, on the coronation of a new Pope and at the feast of St Peter, June 29. It was later transferred to the Pincian Hill and given on the first Sunday in June.

GIRANDOLE, jé-ran'dó-lá, BERNARDO DELLA. See BUONTALENTI, BERNARDO.

GIRARD, jí-rai'd'. A city in Russell Co., Ala., opposite Columbus, Ga., on the Chattahoochee River, and on the Central of Georgia Railroad (Map Alabama, D 3). It is in a cotton growing region and has a cotton mill, a distillery, several wholesale liquor houses, and a concrete plant. Pop., 1900, 3840, 1910, 4214.

GIRARD. A city and the county seat of Crawford Co., Kans., 26 miles south by west of Fort Scott, on the St. Louis and San Francisco, and the Atchison, Topeka, and Santa Fe railroads (Map Kansas, H 7). It is the centre of a fertile agricultural and stock-raising region, near extensive bituminous coal fields, and has breakfast-food factories, a foundry, and stove works, flour mills, brickyards, and other industrial establishments. The "Appeal to Reason" is published here. The water works and electric-light plant are owned by the municipality. Girard has adopted the commission form of government. Pop., 1900, 2473, 1910, 2446.

GIRARD. A village in Trumbull Co., Ohio, 5 miles north of Youngstown, on the Mahoning River, and on the Erie, Baltimore, and Ohio, and the Pennsylvania railroads (Map Ohio, J 3). It has manufactories of iron and steel, leather, and chewing gum. Pop., 1900, 2630, 1910, 3736.

GIRARD, CHARLES (1822-95). An American naturalist, born at Mulhausen, Alsace. He was a pupil and assistant of Louis Agassiz at Neuchâtel and from 1847 to 1850 an associate in scientific investigations in the United States. In 1850-59 he was connected with the Smithsonian Institution. With Prof. S. F. Baird of the Institution, he made extensive studies of reptiles and wrote the article "Reptiles" in Stanbury's *Exploration and Survey of the Great Salt Lake*.

of Utah (1853), and a *Catalogue of North American Reptiles in the Museum of the Smithsonian Institution Part I, Serpents* (1853). Among his writings are *Herpetology of the United States Exploring Expedition under the Command of Captain Wilkes* (1858) and a "Report upon Fishes" for Emory's *Survey of the United States and Mexican Boundary* (1859).

GIRARD, zhé'rai', FIRMIN (1838-) A French genre painter. He was born at Poncin (Ain), and studied at the Ecole des Beaux-Arts under Gleyre. His works are painted anecdotes, such as "The Fiancées," "The First Communion," "After the Ball," "The Betrothal," "A Wedding in the Last Century," "A Death-Bed Wedding" (Bruges Museum), "A Street in Paris" (Helsingfors), "Picardy Interior" (1908), "Waffles" (1909). They are freshly and truthfully executed in brilliant colors and are minutely finished.

GIRARD, JEAN BAPTISTE, "Le Père Girard" (1765-1850). A Swiss educator, born at Fribourg. He entered the Franciscan Order at 16. Although he had done some teaching, he did not begin his definite work in education until 1798, when he published a *Projet d'éducation pour toute l'Helvétie*. In 1805 he became director of the primary schools at Fribourg, and there he remained until 1823. His ideas were considered too liberal, and the Jesuits were more powerful than the Franciscans, so "Le Père Girard" was compelled to give up his school. Until 1834 he taught philosophy at Lucerne, then he came back to Fribourg and lived in what one of his biographers calls "a laborious retirement." Here he wrote his *Enseignement régulier de la langue maternelle* (1844-46), which was awarded a prize by the French Institute. Villeman, who praises him highly, sums up his theory of teaching in these words: "The only, the really popular school is one in which all the elements of study serve in the cultivation of the mind, and where the child is led himself by the things he learns and by the way in which he learns them." Girard was himself a grammarian of the first order, but he said, instead of "a grammar of words," let us have "a grammar of ideas." His influence has grown and still grows in Switzerland, France, and Italy, and is felt in much of the improvement recently made in the teaching in the elementary French schools. A critical judgment places him next to Pestalozzi among Swiss educators.

GIRARD, JULES AUGUSTIN (1825-1902). A French classical scholar, born in Paris, of a family of engravers. He studied at the Ecole Normale and was professor of rhetoric at the College of Vendôme and then at the Lyceum of Lille and in 1874 became professor of Greek poetry in the Faculty of Letters of Paris. He wrote *Essai sur Thucydide* (1860, revised, 1884), crowned by the French Academy, *Le sentiment religieux en Grèce* (1869, 2d ed., 1879), *Etudes sur l'éloquence attique* (1874, 2d ed., 1884), *Etudes sur la poésie grecque* (1884), a French version of Theocritus (1888), and many contributions to the *Revue des Deux Mondes*. In 1873 he was elected a member of the Academy of Inscriptions. Consult the memoir in *Comptes rendus Bulletin* of that Academy for 1902, by Valois Noël.

GIRARD, MARC AMABLE (1822-92). A Canadian statesman. He was born at Varennes, Province of Quebec, was educated at St Hyacinthe College, and was afterward called to the

bar of Lower Canada. When the Legislative Council of Canada became an elective body, Girard was an unsuccessful candidate for it in 1858, and in 1862 he was also an unsuccessful Conservative candidate for the Legislative Assembly of Canada. Later he went to the Canadian Northwest and was called to the Manitoba bar in 1871. He was Provincial Treasurer in 1870-72, Premier in 1874, and between 1879 and 1883 held the offices of Provincial Secretary, Minister of Agriculture, and President of the Council. He was afterward appointed to the Dominion Senate.

GIRARD, NOEL JULES (1816-) A French sculptor, born in Paris. He was a pupil of David d'Angers and Petitot at the Ecole des Beaux-Arts, and first exhibited at the Salon in 1849. His "Vintager Pressing the Grape" (1852) was bought by the government, and his "Comedy" and "Diana" were accepted as the pediment for the side façade of the Paris Opéra. Others of his works are "La Rochefoucauld" (Louvre), "Charity" and "Science" (Hospital of Lariboisière), "St John" and "St Joseph" (church of St Sulpice, Paris).

GIRARD, PAUL FREDERIC (1852-) A French jurist, born in Guingamp, Côtes-du-Nord, and educated at Paris and Rennes. He was professor of law at Montpellier in 1880-88 and at Paris in 1888-93. He was one of the most important writers of his day on Roman law and received honorary degrees from the universities of Breslau and Heidelberg. He translated into French (1887-96) Mommsen's *Römisches Staatsrecht*, edited *Textes de droit romain annotés* (1890-1912), and wrote a valuable *Manuel de droit romain* (1896, 5th ed., 1911, translated into German, 1908), *Histoire de l'organisation judiciaire des Romains* (1901), *Mélanges de droit romain* (1912).

GIRARD, PHILIPPE HENRI DE (1775-1845). A French mechanician and inventor. He was born at Lourmarin, Vaucluse, and manifested a strong aptitude for mechanical invention, also showing a fondness for botany, painting, and literature. Forced by the Revolution to leave France, he painted at Port Mahón, Minorca, and then was a soap-maker at Leghorn. Returning after the fall of Robespierre, he became professor of chemistry and of natural history at Nice. About 1800 he went to Paris and there established a soap manufactory. Girard invented and patented a successful flax-spinning machine, for which a reward of 1,000,000 francs had been offered by Napoleon. In 1813 he established a flax mill at Paris and another at Chaionne, in both of which he made use of his machine, but although he was declared to have earned the reward offered, the fall of Napoleon in 1815 left the decree unfulfilled. Girard now on this account becoming involved in serious money difficulties, he engaged in manufacturing flax in Austria and Poland, and in steam navigation on the Danube until 1825. In that year he became attached to the Russian government to promote the manufacture of flax and later was appointed chief engineer of the mines of Poland. In 1844 he returned to France and exhibited at an industrial exposition a large number of his inventions.

GIRARD, PIERRE SIMON (1765-1836). A French civil engineer, born at Caen. At the age of 24 he was engaged as engineer in the construction of roads and bridges and upon his return from the Egyptian campaign in 1802 was

appointed chief of that department. He built the canal from the Ourcq River to Paris (1802-20), and in 1819 was director of the department of gaslight illumination in that city, in which capacity his researches on the then comparatively new illuminating agent were highly important. His principal writings include *Traité analytique de la résistance des solides* (1798), *Rapport des ponts et chaussées sur le projet général du canal de l'Ourcq* (1803), *Mémoire sur le canal de l'Ourcq et la distribution de ses eaux* (1831).

GIRARD, JÉRARD', STEPHEN (1750-1831)

An American merchant and philanthropist. He was born at Bordeaux, France, the son of a sea captain, became a sailor in 1764, and at the age of 23 was captain and part owner of a ship engaged in the West Indian and American coasting trade. In 1776 he settled in Philadelphia, but continued in the coasting trade until stopped by the outbreak of the Revolutionary War. Espousing the cause of the Colonies, he remained in America, dealt in a small way in army supplies, and in 1780 again embarked in the West Indian trade, this time on a more extensive scale, and in a few years, by a succession of lucky ventures, had accumulated a considerable fortune. In 1810 he became largely interested in the first United States Bank and in 1812, upon the lapsing of its charter, purchased the greater part of its stock, and its building. He retained the old officers, only renaming it "The Bank of Stephen Girard," succeeded to much of the old bank's business, and made it one of the soundest and most successful financial institutions in America. During the War of 1812 he was the chief financial support of the government, advancing it large sums to enable it to continue military operations, and in 1814 took up practically an entire loan of \$5,000,000, after subscribers had been sought in vain. On the re-chartering of the second United States Bank in 1816, he became one of its principal stockholders and a director and exercised a dominant control over its policy for many years. Upon his death he left almost his entire fortune of \$7,500,000 in public benefactions, chief of which was Girard College, in the regulations for the control and management of which he incorporated his ideas as to freedom of thought and religious belief. Girard's personality was forbidding and his personal appearance most unattractive. Penny-pinching and almost miserly in small affairs, a close and shrewd business man, and a hard taskmaster, he was, nevertheless, generous and open-handed in his benefactions even during his life and self-sacrificing and public-spirited to a degree, as his personal services to the people of Philadelphia, when that city was ravaged by a yellow-fever epidemic in 1793, showed. Consult Ingram, *Life and Character of Stephen Girard* (Philadelphia, 1884), and a sketch in *Semi-centennial of Girard College* (ib, 1898).

GIRARD COLLEGE. An institution for the education of orphans, founded in 1848 at Philadelphia, Pa., under the will of Stephen Girard (qv). Mr Girard died Dec 26, 1831, bequeathing the residue of his estate, valued at \$5,260,000, in trust for the establishment of an institution for the education and maintenance of "poor white male orphans." The age of admission was fixed by Mr Girard at between 6 and 10, and the age of leaving at between 14 and 18, at which time students were to be bound out in the arts and trades. Applicants for admission were to be preferred, first as coming

from Philadelphia, second from Pennsylvania, third from New York, and fourth from New Orleans. The courses of study were to be in the main practical, insistence being laid upon "facts and things rather than words or signs." The principles of "pure morality" were to be taught, but the inculcation of religious doctrine in a denominational sense was forbidden, and—most famous clause of a famous will—ministers and ecclesiastics of every sect were prohibited from holding office in the college or entering its premises upon any pretext whatsoever. The exclusion of clergymen has been interpreted as being hostile to religious teaching. The founder said, in express terms, that the provision for the exclusion of clergymen was introduced so that the minds of the boys who were being reared by the institution might be kept free from the confusion of denominational controversies, and was followed in the will by a statement that it was not to be interpreted as being a "reflection upon any sect or person whatsoever." The assembling of the college for chapel service, of which a part invariably is Scripture reading and prayer, is a daily practice. On Sunday two chapel services are held, and at these services addresses are delivered either by some member of the official staff of the college or by some visiting layman.

Preliminary action looking to the due execution of Mr Girard's will was taken by the Philadelphia city councils in 1832, a board of trustees was elected in 1833, and in the same year the corner stone of the main building was laid. This building, erected in the form of a Greek temple, was completed in 1847 at a cost of nearly \$2,000,000. In the meantime suit had been brought by Mr Girard's heirs to have his will set aside, and the case was not decided until 1844, when the United States Supreme Court, notwithstanding the argument of Daniel Webster for the plaintiffs, held the will to be valid. In 1848 the college was formally organized with 100 pupils and 17 instructors and officers, the income at that time being about \$118,000 annually. In addition to the main building there are some 20 other buildings for the purposes of the institution, among them being a chapel, school buildings, dormitories, dining hall, infirmary, mechanical school building, etc. Forty acres are inclosed for the use of the college by a substantial stone wall, 10 feet high. The present normal capacity of the college is 1520 pupils. Through wise investment and careful management the endowment of the college has increased to about \$29,000,000, exclusive of the plant.

Mr Girard provided that the care of his college should be assumed by the mayor, the aldermen, and the citizens of Philadelphia, and their agents, the then corporate title of the city. In the earlier years the board of control was chosen by the councils of the city, and with frequent changes, divisions in the board, and the uncertainty of policy because of these changes, it was found not to be to the interest of the college, and, by act of the Legislature, approved June 30, 1869, the present board of directors of city trusts succeeded the earlier plan of control. This board consists of 12 directors (chosen for life by the board of judges of the courts of Common Pleas of Philadelphia) and the mayor of the city, and the president of the select councils, ex officio. The board manages not only Girard College, but the Girard estate, parts of which

are extended to other purposes, and numerous other bequests. The principal departments of the college are admission and discharge, infirmary and health, domestic or matron's department, steward's department, household and playgrounds, and education. As an educational institution, Girard College is composed of three schools—a primary school of four years, a grammar school of three years, and a high school of four years. Preparation is given for the following mechanical pursuits: trade drawing, carpentry and woodworking, machine-shop practice, electrical construction, foundry, forge practice, and smithing, and printing. On the commercial side instruction is given in book-keeping and office practice, commercial law and customs of business, and shorthand and type-writing. The president in 1914 was Cheesman A. Herrick.

GIRARDIN, zhé'rar'dān', EMILE DE (1802–81). A French legislator and publicist. He was born in Paris, an illegitimate son of Alexander, Count Girardin. In 1831 he married Delphine Gay (q.v.), a well-known writer. After engaging in various journalistic enterprises and being inspector of fine arts in the Martignac Ministry, he was elected in 1834 a member of the Chamber of Deputies, in which he served for many years. As the founder and editor of the conservative and Royalist organ *La Presse*, he secured the patronage of the court, and though compelled to resign the editorship during his term in the Legislative Chamber, he again conducted it from 1851 to 1856 and from 1862 to 1866, when he sold it to the banking house of Millaud & Co. In 1867 he acquired for 500,000 francs the journal *La Liberté*, in which he served the interests of the Liberal Empire, and which he converted into a violent anti-Prussian paper. This was followed in 1871 by *L'Union Française*, and then he bought *Le Petit Journal* to support Thiers. After conducting various other papers, such as the *Journal Officiel* and *La France* (after 1874), he retired in 1881, with a fortune estimated at 1,000,000 francs. As a journalist, he was in some respects the chief leader of his day. The history of his origin and early childhood is recounted in the first novel published by him, and entitled *Emile* (1827). His other writings include *La fille du millionnaire*, a comedy in three acts (1858), *Etudes politiques* (2d ed., 1849), *De l'instruction publique en France* (2d ed., 1842), *La politique universelle, decrets de l'avenir* (4th ed., 1854); *L'Homme et la femme* (1872), *Le supplice d'une femme*, a comedy (1865), frequently republished and highly successful.

GIRARDIN, JEAN PIERRE LOUIS (1803–84). A French chemist, born in Paris. He became professor of chemistry at Rouen in 1828 and at Lille in 1858, and was appointed rector of the academy at Clermont-Ferrand in 1868. He devoted himself especially to the applications of chemistry to art, industry, and agriculture, and published *Considérations générales sur les volcans* (1830), *Du sol arable* (1842), *Des fumiers et autres engrais annuels* (1875), *Traité élémentaire d'agriculture* (1874), *Chimie générale et appliquée* (1868–69).

GIRARDIN, MADAME DE. See GAY, DELPHINE.

GIRARDIN, SAINT-MARC. See SAINT-MARC GIRARDIN, FRANÇOIS AUGUSTE.

GIRARDON, zhé'rar'dōn', FRANÇOIS (1628–

1715). A leading French sculptor of the court of Louis XIV. He was born at Troyes, March 17, 1628, the son of a bronze founder, Nicolas Girardon. As a boy, he entered the service of one Baudesson, a wood carver and furniture maker, whose son was a painter of some importance. Although intending to become a sculptor, Girardon learned to paint and at the age of 15 decorated a chapel of Ste Julie in Troyes. There is some good work of the Renaissance in Troyes, which was a source of inspiration to the sculptor. His first work in sculpture was a statue of the Virgin in his native city. At this time the Chancellor Séguier undertook certain improvements at his château of Saint-Liébaud. Baudesson, who was employed on the work, took with him the young Girardon. Séguier became interested in the boy and, as he had been with Le Brun, sent him to Paris and afterward to Rome. In Rome, through the influence of the painter Pierre Mignard, also of Troyes, he came under the influence of Lorenzo Bernini, the greatest sculptor of that day. When Girardon removed to Paris in 1652, he studied with Magnier and François Auguier and later came into relations with Le Brun and worked under his powerful direction for many years. He entered the Academy of Painting and Sculpture, Jan 7, 1657, and in the same year married Catherine Duchemin, a painter of considerable skill, who was herself admitted to the Academy in 1663. In 1667 he was sent to Toulon to superintend the decorations of the vessels of the royal navy, and in 1668 he visited Rome a second time, returning to Paris in 1669. The rôle which he now played was a large one. He was lodged in the Louvre, was professor at the Academy (after 1659), and enjoyed the full favor of the court. In 1695 he became chancellor of the Academy. The most notable works of Girardon were the monument of Richelieu in the church of the Sorbonne, Paris, which Alexandre Nenoir saved at the risk of his life in the Revolution, and the equestrian statue of Louis XIV, which once stood in the Place Vendôme. The group of the "Rape of Prosperine" at Versailles may also be mentioned. There are many busts, bas-reliefs, and small works in the Louvre (Paris). Of his decorative work, done under the influence of Le Brun, there is a little in the Gallery of Apollo in the Louvre. The greater part of it, however, is grouped about the palace and park of Versailles. Girardon was a skillful technician, but his art was somewhat theatrical and lacking in individuality. Consult Coirard de Breban, *Notice sur la vie et les œuvres de Girardon* (Paris, 1850), Genevay, *Le style Louis XIV* (ib., 1886), Gonse, *La sculpture française* (ib., 1895), Lambert, *Versailles et les deux Trانون* (ib., 1900), Lami, *Dictionnaire des sculpteurs de l'école française sous le règne de Louis XIV* (ib., 1906).

GIRARDVILLE. A borough in Schuylkill Co., Pa., 58 miles northwest of Reading, on the Philadelphia and Reading and the Lehigh Valley railroads. It has a State hospital for persons injured on railroads and in mines. The chief industry is the mining of anthracite coal. Settled in 1841, it is governed under a charter of 1873 by a chief Burgess, elected every three years, and a council of nine members. Pop., 1900, 3666, 1910, 4396.

GIRART DE ROSSILHO, zhé'rar' de rōs-sē'lyō. An epic poem composed in a northern Provençal dialect and forming part of the Car-

lovingian cycle Consult Saintsbury, *French Literature* (6th ed, Oxford, 1902)

GIRASOL, jīr'a-sōl (Fr, Sp, Portug *girasol*, from It *girasole*, from *girare*, to turn, from Lat *gyrus*, circle) A name given to precious stones that show reflections of bright red or yellow light, which apparently come from the interior of the mineral The name is especially applied to the *fire opal*, which is of a milky bluish color, translucent, and shows reddish reflections in a bright light The best-known specimens are found at Zimapan, Mexico, and in the Faroe Islands (See **OPAL**) The name has also been given to the *asteriated sapphire*, or star sapphire, fine specimens of which have been found in India Girasols were highly esteemed by the ancients and when of good quality commanded high prices They are now made artificially and are no longer so highly prized as formerly

GIRAUD, zhē'rō, GIOVANNI, COUNT (1776-1834) An Italian dramatist, of French descent, born in Rome His first play *L'Onestà non si vince* (1798) was a success After taking part in politics, he returned to the stage with *L'Ajo nell'imbarazzo* (1807) He was made director general of all the theatres in Italy by Napoleon in 1809 His comedies are amusing, but lack literary merit His *Commedie* were published in Milan (1823) The best known of them are *Don Desiderio*, *La capricciosa confusa*, and *La conversazione al bujo*

GIRBADEN, gēr'ba-den, CASTLE OF An extensive ruined fortress near Grendelbruch, in Lower Alsace, the inner fortress of which belongs to the tenth century and the outer castle to the early thirteenth Originally possessing 14 gates and 14 courts, it still retains evidences of the elaborateness of its design in its great square donjon, and in its hall with windows bordered with columns arranged in clusters

GIRDER A beam which is intended to be supported at either end and to carry a vertical load between the ends Girders are simple when they are supported only at the two ends, continuous when they extend over one or more intermediate supports as well, solid when, like a rolled I-beam, the upper and lower flanges are connected by a solid web, and braced when the upper and lower flanges are connected by an open framework of diagonal or combined diagonal and vertical members (For description of plate girders and braced girders, see **BRIDGE**) A box girder is a solid girder in which the flanges are connected by two web plates in such a manner that a cross section of the girder is box-shaped or rectangular in form (See **ROLLING MILL** for a description of steel shapes) Girders may be of timber, but they are more commonly of steel, which has almost entirely replaced cast iron and wrought iron

GIRDLE (AS. *gyrdel*, Ger *Gürtel*, from Eng *gyrd*, to encircle with cord or band, connected with Eng *yard*, Ger *Garten*, and Lat *hortus*, garden) The belt fastened around the body to confine the long loose robes worn by both men and women previous to the fifteenth century (See **COSTUME**) It was minutely prescribed to the children of Israel to be worn by priests, made "of gold, of blue, and purple, and scarlet, and fine twined linen" (Ex xxviii. 4, 8, 33), but it was worn by others as well All through the Bible "to gird up the loins" is a common symbol of activity and alertness. The *zona* (Gk *ζώνη*) of classical antiquity was a broad band worn around the waist by

young women before marriage, hence the expression *zonam virgineam solvere* is a periphrasis for marriage Men also, among the Greeks and Romans, wore a broad band or belt which often served for carrying money and other small articles The *cingulum*, sometimes called *cestus*, Gk *στροφόριον*, was worn higher under the breasts, as in the modern Empire costume The name *cingulum* was also applied to the *balteus*, or sword belt, which formed a regular part of the Roman soldier's uniform and usually passed over the left shoulder In the Middle Ages girdles became magnificent and expensive, being made of damask, brocade, cloth of gold, and other costly materials, and adorned with jewels and embroidery, until sumptuary laws in England and elsewhere prevented For the girdle in church vestments, see **COSTUME**, **ECCLIASTICAL**

GIRDLE OF VENUS (trans of Lat *cestum Veneris*) A remarkable ctenophoran jellyfish inhabiting the Mediterranean, of a ribbon-like shape, some 5 or 6 feet in apparent length by about 2 inches in breadth, although, considered with reference to the structure of the animal, the apparent length is really its breadth, and the apparent breadth its length The mouth is situated in the middle of the inferior edge, and the stomach is embedded in the gelatinous substance The edges are bordered by rows of swimming plates, by the movements of which the creature seems to be propelled in the water It exhibits lovely iridescent colors by day and brilliant phosphorescence by night Its substance is so delicate that it is difficult to obtain a perfect specimen

GIRDLER A small cerambycid beetle (*Onocideres cingulatus*), which girdles the twigs of hickory, pear, and other trees It is grayish brown, with a light-colored band across the elytra In August this beetle lays its eggs near the tips of twigs, then gnaws a deep furrow around the twig behind them The winds of autumn break off the end of the girdled twig which falls to the ground Then the eggs hatch the grubs feed upon the decaying wood, leaving only a shell of bark, and attain their full growth during the summer They then pupate and produce imagoes a year from the time the eggs were laid Extensive damage sometimes results from the great numbers of these twig girdlers

GIRDWOOD, GILBERT PROUT (1832-1918)

A Canadian physician and educator He was born in London, England, and was educated at University College and St George's School of Medicine in that city In 1864 he was appointed assistant surgeon of the British Grenadier Guards He accompanied the First Battalion to Canada in 1862 at the time of the Trent Affair, and after his return to England left the army to live in Montreal He was appointed surgeon of the Third Regiment, Victoria Rifles, in 1865 and served with it during the Fenian raid of 1866 In 1872-94 he was professor of practical chemistry in the medical faculty of McGill University, Montreal, and professor during 1879-1902, after which he became professor emeritus Girdwood was also appointed director of the electrical department and the Roentgen rays, Royal Victoria Hospital, and in 1903 was president of the Roentgen Society of America He was one of the original fellows of the Royal Society of Canada in 1882, and later became a member of several scientific societies in Canada, the United States, and Great Britain He con

tributed many articles on medical and surgical subjects to the London *Lancet*, the *Montreal Medical Journal*, and the *Transactions of the Royal Society of Canada*

GIRGEH, jër'gë (from Coptic *Girgis*, George, in honor of the patron saint of the town) The capital of the Egyptian province of the same name, and former capital of Upper Egypt, situated on the left bank of the Nile and about 90 miles southeast of Assiut by rail (Map: Egypt, C 2) It has a number of mosques and a government cotton factory The town is noted for its weekly market held on Tuesday The environs contain numerous ancient tombs and several cemeteries In the vicinity is an old United Copts convent Pop, 1897, 17,913, 1913, 19,893, of whom 5443 are Copts

GIRGENTI, jër-jan'te (ancient Agrigentum, q v) An episcopal city, the capital of the Province of Girgenti, Sicily, on the river Drago, 84 miles by rail southeast of Palermo, 720-1080 feet above sea level (Map Italy, D 6) It is 3 miles from the Mediterranean and 6 miles by rail from Porto Empedocle (q v) through which it carries on its trade The atmosphere is usually clear and mild The town is the seat of a bishop, of an American consular agent, and is the military headquarters for the Province of Girgenti The fourteenth-century cathedral of San Giorgio, with unfinished campanile, has been completely modernized and contains a Madonna by Guido Reni and a famous ancient marble sarcophagus with relief, illustrating the story of Hippolytus (q v) In the cathedral archives are many documents of the Norman period Catacombs extend under the entire town The city museum has a fine marble statue of Apollo, vases, coins, and terra cottas Girgenti commands a beautiful view of the sea, and at sunset in clear weather Pantelleria, 90 miles to the southwest, can be seen It has a chamber of commerce, an important public library, founded in 1765 by Bishop Lucchesi, a technical school, a royal technical institute, a royal gymnasium, a royal female normal school, a seminary, and a municipal theatre The most important commercial product is sulphur, of which about 3,000,000 quintals (metric) are exported annually There are also important salt mines Other products are wine, oil, almonds, grain, cheese, honey, earthenware, salt fish For the early history of Girgenti and for the remains of its former splendor, see AGRIGENTUM Pop, 1901, 25,024 (commune), 1911, 26,823 Consult Picone, *Memorie storiche agrigentine* (Girgenti, 1865), Siro, *Le province d'Italia Girgenti* (Torino, 1886), Rocco, *Girgenti* (Bergamo, 1903), Baedeker, *Southern Italy* (16th Eng ed, Leipzig, 1912)

GIRL OF THE GOLDEN WEST, THE (La Fanciulla del West). An opera by Puccini (q v), first produced in New York, Dec 10, 1910

GIRLS' CLUBS. See WORKING WOMEN'S CLUBS.

GIRNAR, gîr-nar'. A sacred mountain of remarkable aspect, in the peninsula of Kathiawar, part of the native State of Gujarat, Bombay, India, in lat 21° 30' N and long 70° 42' E, 230 miles northwest of Bombay Above luxuriant hills and valleys surrounding its base rises a bare and black rock of granite to the height of about 3500 feet above the sea The summit is broken into various peaks, its northern and southern sides being nearly perpendicular

An immense boulder, which seems to be poised on one of the scarped pinnacles, is called the Beiru Jhap, or Leap of Death, from its being used by devotees for the purpose of self-destruction On a ledge about 600 feet below the summit there is a group of 16 ancient Jain temples

GIRNDT, gërnt, OTTO (1835-1911) A German dramatist He was born at Landsberg-am-der-Warthe and was educated at Berlin and Heidelberg He wrote many plays, two of which were awarded prizes at Vienna and Munich They include the comedies *Y 1* (1865), *Und, Am andern Tage, Orientalische Warren* (1877), *Die Sternschnuppe* (1886), a farce, with Mosler, *Nervos*, a farce, with Moser (1889), *Endlich* (1891), *Dreizehn* (1892) His tragedies include *Danckelmann* (1883) and *Die Schlacht bei Torgau* (1900) His novels and tales are less popular

GIRODET-TRIOSON, zhë'rô'da' tië-d'zôn', ANNE LOUIS (1767-1824) A French historical painter His real name was Girodet de Roussy, and he was born at Montargis He was adopted and educated by M Trioison, the court physician, whose name he assumed in later years He was a pupil of David, and in 1789 he took the Prix de Rome In pursuing his studies at Rome he cultivated a sentiment in his work which had not developed in the studio of David, where correct and classical drawing was considered paramount His "Sleep of Endymion," now in the Louvre, was painted at this time, it is said the figure was copied from a bas-relief In 1792 Girodet painted "Hippocrates Refusing Presents Sent from the King of Persia," a gift to Dr Trioison, who bequeathed it to the Medical School of Paris In 1802, at the request of Napoleon, he executed "Ossian and his Warriors Receiving the Shades of French Warriors," and in 1806 he exhibited his "Scene of the Deluge" (now in the Louvre), which received a prize over David's famous "Sabines," but it has been severely criticized as poor in composition "Pygmalion and Galatea," his last and one of the best works, was exhibited in 1810 His large historical pictures, the "Surrender of Vienna to Napoleon" (1808) and the "Insurrection at Cairo" (1810), both at Versailles, are less pleasing In the "Burial of Attila" (1808, Louvre), Girodet was more successful His efforts to combine the teachings of the classic with his own romantic spirit sometimes produced grotesque results, but Girodet helped to make possible the later school of the Romanticists Among his portraits that of Chateaubriand is perhaps the best He was made member of the Institute in 1815 and Chevalier of the Legion of Honor in 1816 He died in Paris and, by order of Louis XVIII, was decorated with the cross of Officer of the Legion of Honor when in his coffin Consult Coupin, *Œuvres posthumes de Girodet Trioison* (Paris, 1829)

GIRÓN, hë-rôn'. A town of Colombia, in the Department of Santander, on the Lebrija River. It has gold mines and produces tobacco Pop, 1912, 6202 It was founded in 1631

GIRÓN, hë-rôn', DON PEDRO, MARQUÉS DE LAS AMARILLAS See AHUMADA

GIRÓN, hë-rôn', DON PEDRO TELLEZ Y. See OSUNA

GIRÓN, FRANCISCO HERNÁNDEZ (1510-54) A Spanish soldier, born at Cáceres, Estremadura He went to the Indies in 1535 and, engaging

in the wars in New Granada, assisted in its conquest. In Peru he fought under the Viceroy, Blasco Núñez de Vela, and served ably in the army of President Gasca. Becoming disgruntled he led a revolt against the government in 1553. The next year, after defeating the royal forces under Alvarado, he entered Cuzco in triumph. His cause then waned, he was captured, condemned to death, and beheaded at Lima. The account of the revolt is given by Girón himself in the *Rebelión de Francisco Hernández Girón* published in vol. xiii of the *Colección de libros españoles raros ó curiosos* (Madrid, 1879). Consult Mendiburn, *Diccionario histórico-biográfico del Perú* (Lima, 1874-90).

GIRONDE, zhé'iond'. A maritime department in the southwest of France, formed of part of ancient Guenne, bounded on the west by the Bay of Biscay, on the north by Charente-Inférieure, on the east by Dordogne and Lot-et-Garonne, and on the south by Landes (Map France, S, D 4). Area, 4140 square miles. The surface is generally level, but hilly in the east. It is watered by the Garonne, which expands into the estuary called the Gironde, and by its affluent the Dordogne. At the mouth of the Gironde stands the famous lighthouse, the Phare de Cordouan, dating from 1585. Gironde is one of the principal wine-producing departments of France, over 14 per cent of the total area being vineyards. The other products are grain, vegetables, fruit, and hemp. The oyster industry of the Bay of Arcachon is important. Pop., 1901, 821,131, 1911, 829,095. Capital, Bordeaux.

GIRONDISTS, jī-rōn'dists (Fr. *Girondins*, from *Gironde*, a department of France). The party of moderate Republicans during the French Revolution (1791-93). When the Legislative Assembly met in October, 1791, the most remarkable group of men in it were the Deputies, most of them new men, from the Department of the Gironde. Baenenes, Ducos, Servière, Vergniaud, Gaudet, Gensonné, Sers, and Grangeneuve were the chiefs of their group. They soon showed themselves to be orators of ability, and their moderate republicanism drew to their side such men as Brissot, Roland and his wife, Condorcet, Pétion (later mayor of Paris, 1791), Dumouriez, and Lacoste. They assumed the name Girondins, controlled the *Patriote Français*, and their influence dominated the Jacobin Club. For more than a year they directed the affairs of government. They had a majority in the Assembly, and the King was forced to select Roland, Dumouriez, Clavière, and Servan as ministers in March, 1792. The forced resignation of the Girondist ministry, some three months later, led to the popular insurrection of June 20. Though there were elements of dissension between the Girondists and the Jacobins as early as the spring of 1792, both parties united in bringing about the overthrow of the monarchy through the insurrection of Aug 10, 1792. The former were idealists and the latter practical men. The responsibility for the September massacres is harder to determine, but probably the leaders of the Girondists were not implicated in the atrocities of the mob, although they claimed the credit for the results. After that date they lost more and more of their popularity, though their eloquence still dominated in the Assembly, which despised them as weaklings. The result was that the Jacobins obtained the upper hand and ousted the Girondists from office under the National Convention.

Danton and his followers triumphed over Roland and his, Dumouriez deserted the side of the Revolution, and not a single Girondist figured on the newly formed Committee of Public Safety. The failure of the Girondists to arrest and impeach Marat was followed by the invasion of the hall of the Convention by a Jacobin mob on May 31, 1793, and the arrest, on June 2, of about 20 of the leaders of the party. Many others fled to the provinces or escaped from France. Unsuccessful risings took place throughout France in their behalf, the only result being that further arrests were made. On Oct 3, 1793, the prisoners were accused before the Convention of conspiracy against the Republic and were sent to be tried by the Revolutionary Tribunal. On October 24, therefore, they were arraigned before this body. They were at first allowed to defend themselves, but their speeches were so eloquent and their innocence so apparent that the court could not condemn them, and the Convention was forced to order that the investigation be closed, and that the prisoners be executed, Oct 31, 1793. This bloodthirsty decree was carried out the same evening. Brissot, the leader of the party (from whom they were sometimes known as Brissotins), Vergniaud, Gensonné, Ducos, and 16 others were sent to the Place de Grève. On the way thither they chanted the *Marseillaise* and met their death with splendid courage. Others of the Girondists were subsequently brought to the guillotine, including Madame Roland, whose charms, intellect, and ardor had made her an inspiring influence in the party. In the provinces also there were executions. Roland, Vilazé, Rebecqui, Pétion, Buzot, and Condorcet preferred suicide to the guillotine, and by the close of 1794 the Girondist party had all but disappeared. Those of the party who survived, including Lanjumeau, Defermon, Pontécoulant, Louvet, Isnard, and La Rivière, reappeared in the Convention after the fall of Robespierre and the Terrorists, but they no longer formed a party of importance. Lamartine has written a panegyric on the Girondist party, *Histoire des Girondins* (Paris, 1847), translated by Ryde, and published in London in the same year. For more impartial and accurate accounts, consult Guadet, *Les Girondins* (new ed., Paris, 1889), De Patris, *L'Esprit financier des Girondins* (ib., 1909), Goetz-Bernstein, *La politique extérieure de Brissot et des Girondins* (ib., 1912). In English the following are worth consulting: Mignet, *The French Revolution* (London, 1826); Morse-Stephens, *History of the French Revolution* (New York, 1911). See FRENCH REVOLUTION, also the special articles on the various Girondist leaders, with the authorities referred to there.

GIRON LE COURTOIS, zhé'rōn' le kōōr'twa' (Fr. Giron le Courtois). The hero of a thirteenth-century romance of the same name, by Rusticien, derived from an earlier romance, *Palamedes*, by Elie de Borron. The printed edition rests upon Rusticien's version.

GIROUARD, zhé'rōō'ar', DÉSIÉ (1836-1911). A Canadian legislator and jurist. He was born at St. Timothée, Province of Quebec, and was educated at Montreal College and McGill University. He studied law, was called to the bar in 1860, and practiced his profession in Montreal. A work published by him under the title *Essai sur les lettres de change et billets promissaires* made him widely known and insured his rapid advancement in the profession. He was elected a Con

servative member of the Dominion Parliament (1878), and continued a member until 1895, also acting for many years as chairman of the Standing Committee on Privileges and Elections. He strongly opposed the execution of Louis Riel (qv) and introduced and carried several bills, the most important of which was the so-called Deceased Wife's Sister Bill (1882). In 1895 he was appointed a puisne judge of the Supreme Court of Canada, retaining that position until his death. His literary productions include two volumes of interesting essays upon legal subjects, a collection of historical essays on the District of Montreal, translated from the French and published under the title of *Lake St Louis, Old and New, Illustrated*, and *Cavalier de la Salle* (1893), and *Les anciens postes du Lac Saint Louis* (1895).

GIROUARD, SIR EDOUARD PERCY CRANWILL (1867-). A Canadian soldier, railway engineer, and administrator. Born in Montreal, he was educated at the Royal Military College, Kingston, Ontario. For some time he was on the engineering staff of the Canadian Pacific Railway. In 1888 he was gazetted second lieutenant of the Royal Engineers, in 1891 lieutenant, and in 1890-95 was railway traffic manager at Woolwich. He served under Sir Herbert (now Earl) Kitchener, with the Dongola expedition, in 1896-97, during 1896-98 was director of the Soudan Railways, and in 1898-99 was president of the Egyptian Railway Board. He took part in the South African War (qv) and in 1899-1902 was Director of Railways during and after that conflict. In 1902-04 he was Commissioner of Railways for the Transvaal and the Orange River Colony, in 1904 was promoted lieutenant colonel, and in 1906 became assistant quartermaster general, Western Command, Chester, England. His career as administrator began with his appointment in 1907 as High Commissioner of the Protectorate of Northern Nigeria. Then, in 1909, having been Governor of that protectorate for two years, he was promoted colonel and in 1909-12 was Governor and commander in chief of the East Africa Protectorate. In 1900 he was knighted. He published *History of the Railways during the War in South Africa, 1899-1902* (1905).

GIROUARD, JOHN JOSEPH (1795-1855). A Canadian revolutionary leader, born in the city of Quebec. Early left an orphan, he was educated by Abbé Gatién. After his admission to the bar in 1816 he practiced law at St Benoit. The disputes between the Governor and the popular branch of the Legislature in regard to the voting of supplies were then rapidly approaching a crisis. The question of responsible government was involved. (See **POLITICAL PARTIES, Canada**.) Girouard vehemently took the popular side and in 1830, having been elected to the Assembly, voted for the refusal of money supplies unless granted by a majority of that body. He spoke at many popular meetings, though without urging actual rebellion. However, when the rebellion broke out in 1837, Girouard took command of a local body of insurgents, whom he soon advised to discontinue their resistance. He fled to the United States, but returned and was imprisoned, though released next year after a proclamation of amnesty. He then returned to legal practice at St Benoit for the remainder of his life. Though requested in 1842 to join the Lafontaine-Balhom ministry as Commissioner of Crown Lands, he declined.

GIROUETTES, zhé'róo'é't', LES (Fr, the weather vanes). A term of reproach applied in the *Dictionnaire des Giroettes* (Paris, 1815) to those who changed their political party on the return of the Bourbons after Napoleon's fall. The number of changes in political faith was indicated by a corresponding number of weathercocks printed after the names.

GIRTIN, gē'tin, THOMAS (1775-1802). An English water-color painter and etcher. He was born in Southwark, and was apprenticed to Edward Doyes, the mezzotint engraver. Girtin was one of the founders of the English water-color school and with his friend Turner inaugurated the practice of "painting" in water color, as distinguished from tinting. He was a contributor to the exhibitions of the Royal Academy from 1794 to 1801, his subjects including views of London, of Paris, 20 of which he etched himself, and scenes in northern England, Scotland, and Wales, where he made extensive sketching tours, he also painted many English cathedrals. In 1797 he painted a panorama of London, and in 1801 exhibited an oil painting, "Bolton Bridge," at the Royal Academy. His work is characterized by largeness of manner, depth and harmony of color, bold distribution of masses, and solemn grandeur of sentiment. Despite his early death from tuberculosis, which took place in London, Nov 9, 1802, he exercised a vast, though indirect, influence on modern landscape painting, and advanced the art of water-color painting in technique, color, and poetic interpretation. The British Museum possesses a fine collection of his drawings. Other works are found in the South Kensington Museum, the Whitworth Institute, Manchester, the National Gallery of Scotland, and the National Gallery of Ireland. Consult Miller, *Turner and Girtin's Picturesque Views* (London, 1854).

GIRTON (gēr'ton) COLLEGE. One of the most noted institutions for the higher education of women in England, founded through the efforts of Miss Emily Davies. It was established in 1869, in a rented house at Hitchin, Hertfordshire, with six students, and was conducted in the main under the influence of members of Cambridge University, from among whom its lecturers were recruited. The inconvenience of its distance from that university led to its removal, in 1873, to its present location, about 2 miles from Cambridge. Since then it has increased greatly in numbers and influence. Its students follow essentially the same course of work as the Cambridge undergraduate who studies for honors. Since 1881 its members have been admitted to the university examinations, and their names appear in the tripos, or honor lists, in the university calendar. They do not, however, receive degrees from the university, but are granted degree certificates upon satisfying the university requirements. The usual enrollment of the college is about 160. The buildings are very handsome, forming three sides of a quadrangle, and are in attractive grounds. The administration is vested in an executive committee, a mistress, and a vice mistress, and the instruction is carried on, as in a college of the university, by lecturers and tutors. Consult E E C Jones, *Girton College* (London, 1913). See **CAMBRIDGE, UNIVERSITY OF, COLLEGIATE EDUCATION FOR WOMEN**.

GIRTY, gēr'ti, SIMON (1741-1818). A notorious renegade leader of the Indians. He was born in what is now Dauphin Co, Pa, was cap-

tured by the Indians, along with the rest of his family, at Fort Granville, in 1756, was released in 1759, and acted as an interpreter for some time after the conspiracy of Pontiac. In Lord Dunmore's War he served against the Indians and for a short time thereafter was a second lieutenant in the Virginia militia. In 1776 he was appointed an Indian interpreter for the United States, but was soon discharged, after which he enlisted troops in the vicinity of Fort Pitt for service against the English. He went over to the English in April, 1776, was attainted of high treason by the Pennsylvania Legislature in July, and became an interpreter in the employ of the British Indian Department. His name soon became a terror throughout the Western settlements, and innumerable atrocities were attributed to him, though his influence and position among the Indians were greatly exaggerated. In August, 1782, with 600 Indians he ambuscaded a party of Kentuckians at Blue Licks and killed more than 60 of them. After the Revolution he acted as an interpreter for the English and was extremely active in instigating the Indians to attack the American frontiersmen. He commanded the Indians who attacked Dunlap's Station, on the Great Miami, in February, 1791, led the Wyandots at the defeat of St. Clair, commanded the Indians who attacked Fort Jefferson, on the Mississippi, in June, 1791, and in 1794 participated in the battle of Fallen Timbers. During the latter part of his life he lived near Detroit, across the Canadian border. His brothers, George (1745-c 1812), James (1743-1817), and Thomas (1739-1820), also fought with the Indians against the United States. Consult Butterfield, *History of the Girty's* (Cincinnati, 1890).

GIRVAN, gër'van. A seaport and market town on the west coast of Ayrshire, Scotland, at the mouth of the Girvan, 21 miles southwest of Ayr (Map Scotland, D 4). Weaving was formerly its leading industry and, though still carried on, has been superseded by the winter herring fishery since the enlargement of the harbor. There is an export trade in coal and limestone from adjacent districts. It has grown in favor as a health resort and watering place. Pop, 1901, 4019, 1911, 5331.

GIRY, zhér'è', JEAN MARIE JOSEPH ARIEUR (1848-99). A French historian, born at Trévoux, France. He was educated at the Ecole des Chartres, where he held the professorship of diplomacy after 1885, and at the Ecole des Hautes Etudes, where he became a lecturer in 1874. He did much to promote the study of the origins of French cities and revived interest in diplomacy. His publications include *Histoire de la ville de Saint-Omer et de ses institutions jusqu'au XIVe siècle* (1877), *Les établissements de Rouen* (1883-85), *Documents sur les relations de la royauté avec les villes de France de 1180 à 1314* (1885), *Etude sur les origines de la commune de Saint-Quentin* (1887), *Manuel de diplomatique* (1894). The last-named work won him election to the Academy of Inscriptions and Belles-Lettres in 1896.

GISANDER, gë'zan-dër. The pseudonym of the German author JOHANN GOTTFRIED SCHNABEL (qv).

GISBORNE, gíz'börn, FREDERICK NEWTON (1824-92). A Canadian inventor and electrician, born in Broughton, Lancashire, England. In 1842 he left England for a trip around the world and finally settled in Canada in 1845,

where he spent two years in farming. In 1847 he entered the employ of the Montreal Telegraph Company as an operator, and in the same year was placed in charge of their new office at Quebec. By close study he soon became an expert electrician, and original improvements in methods and instruments soon attracted so much attention to his work that, in 1849, he received the appointment of superintendent of the lines of the Nova Scotia government at Halifax. Here he began to study the problems of ocean telegraphy. In 1852 he laid the first deep-sea cable in American waters, between Prince Edward Island and New Brunswick. In 1853 he went to New York City, where he became associated with Cyrus W. Field, and on the organization of the New York, Newfoundland, and London Telegraph Company, was appointed chief engineer of the new company. In that capacity, in 1856, he laid the land lines across Newfoundland. He was the commissioner for Newfoundland at the London Exposition in 1862 and at Paris in 1865. In 1879 he was appointed superintendent of the Canadian government telegraph service, which position he held until his death. Among his numerous inventions were an anti-induction ocean cable, electric and pneumatic ship signals, an anticorrosive composition for the bottoms of iron ships, and an electric recording target.

GISCO (Gk. Γίσκων). The name of three Carthaginian generals. 1. A son of the Hamilcar who was defeated by Gelon at the battle of Himera 480 B.C. In consequence of the defeat Gisco was banished to Selinus, in Sicily, where he died. 2. The son of Hanno. He unsuccessfully opposed Timoleon (qv) after the latter had defeated the Carthaginians at the river Crimissus 339 B.C. (Consult Holm, *Geschichte Siciliens*, II (Leipzig, 1874), and Beloch, in *Klio*, VII, 1b, 1907). 3. A commander of the Carthaginian garrison at Lilybaeum, at the end of the First Punic War. In 241 B.C. he was seized and murdered by the mercenary troops who had begun the civil war called the "Inexpiable," and with whom the Carthaginian government had commissioned him to treat.

GISELA, gí'ze-la (?-1043). A queen of Germany and Roman empress. The widow of Duke Ernest of Swabia, she married (1016) Conrad II and was crowned with him at Rome in 1027. She exerted a considerable political influence, particularly in securing the annexation of Burgundy to the German possessions. Her influence in the Church also was paramount. She was celebrated for her beauty, her generosity, and her profound interest in the affairs of state and of science. She was the mother of the Roman Emperor Henry III.

GISLASON, gís'la-són, KONRAD (1808-91). An Icelandic philologist, born at Longumyrri and educated at Copenhagen. He was professor of ancient Norse languages at Copenhagen from 1853 to 1886 and became known as a philologist through his excellent editions of the *Gíslasaga* (1849) and the *Njála* (2 vols, 1875-89) and more especially through his grammatical studies of Icelandic and his Danish-Icelandic Dictionary, which is recognized as an authority on those languages. Gíslason bequeathed his entire fortune to the University of Copenhagen. Consult *Arkiv for nordisk Filologi*, VII-VIII, and *Tímarit hins íslensz Bókmentafjelags*, XI.

GISORS, zhé'zór'. A town in the Department of Eure, France, on the river Epte, 33 miles northeast of Evreux. It contains a richly

decorated mediæval church, and in its vicinity on a hill are situated the remains of an old castle constructed by Henry II of England. The town is famous as the scene of a battle in 1198, when the English under Richard I defeated the French. In this battle the expression "Dieu et mon Droit," which has since become the motto of the royal arms of England, was used for the first time by Richard I. The manufacture of felt is the only industry of any importance. Pop., 1901, 4801, 1911, 5508.

GIS'SING, GEORGE ROBERT (1857-1903) An English realistic novelist, whose rare talent (or genius) was but slowly recognized. Born at Wakefield, he was educated at Owens College, Manchester, and at the University of London, in both which institutions his career was brilliant. He made an unhappy marriage—he was later to make a second similar matrimonial venture—and in 1876 went to America, where for some time he eked out a precarious living by writing and teaching. Later he went to Germany, teaching and studying there to return to London and make literature his profession. For years he suffered extreme poverty, living and writing in wretched London garrets and cellars. After 1882 the legend of his abject poverty seems to have been pure fiction. From that date to the end of his life his work as a tutor and his pen kept him for the most part in comparative comfort. But struggle, toil, and privation had broken his health, and he died at the age of 46. The novels *The Unclassed* (1884), *Demos* (1886), the first of his books to attract wide attention, *Thyrza* (1887), one of the best of his stories, and *The Nether World* (1889), well represent him as a minutely faithful, if not altogether sympathetic, novelist of the lower classes. In the bulk of what remains of his work he is the painter of the middle and professional classes, and the best of these books are studies of unusual or abnormal modern temperaments against a middle-class background. These stories generally involve problems concerning marriage, the position of woman, education, the relation of class to class, etc. In this second group are *Isabel Clarendon* (1886), *A Life's Morning* (1888), *The Emancipated* (1890), the brief and inferior *Denzil Quarrier* (1892), *The New Grub Street* (1891), unsurpassed as a picture of middle-class literary life, *Born in Exile* (1892), in which the author is seen to great advantage, *The Odd Women* (1893), also a notable book, *In the Year of Jubilee* (1894), the brief but interesting *Eves Ransom* (1895), *The Paying Guest* (1895), *Sleeping Fires* (1895), *The Whirlpool* (1897), one of the best of Gissing's novels, *The Crown of Life* (1899), *Our Friend the Charlatan* (1901), and *Will Warburton* (1905). Standing alone, must be mentioned *Veranilda* (1904), left incomplete at the author's death by a few chapters, a very knowledgeable and carefully written story of Roman life in the sixth century, which was an outcome of Gissing's lifelong devotion to classic history and literature. His work includes also *Human Odds and Ends* (1898), *The House of Cobwebs* (1906), both volumes of short stories, *The Private Papers of Henry Ryecroft* (1903), a blend of fiction and autobiographic self-revelation, and the personal records of travel in *By the Ionian Sea* (1901). Gissing, if not a born story-teller, was an accomplished and singularly intelligent novelist. He follows in a measure the large

descriptive scheme of Tolstoy and of Zola. The master of a trained and supple style, he could write at his best an imaginative prose of rare beauty and power. Consult the introduction by Thomas Secombe to *The House of Cobwebs* (1906), Paul Elmer More's illuminating study in *Shelburne Essays* (6th series, New York, 1908), F. Swinnerton, *Gissing: A Critical Study* (1b, 1912), Morley Roberts, *The Private Life of Henry Maitland* (1b, 1912), in which Maitland is Gissing.

GITANOS, га-та'но́с. See GYPSIES.

GITSCHIN, gi-chên', or **JICIN**, yě'chên. A town of Bohemia, Austria, situated on the Cidlina, about 50 miles northeast of Prague (Map Austria-Hungary, D 1). Among the noteworthy buildings are the handsome palace built in 1630 by Wallenstein, the former Jesuits' College (now used as barracks), the fine church dating from 1655, a Gymnasium, and a teachers' college. The chief industries are manufactures of sugar, machinery, and paper, it also carries on a considerable trade in grain. In the neighboring Carthusian monastery of Walditz Wallenstein was interred, but in 1785 the body was removed to Munchengrätz. Near here, on June 29, 1866, the Prussians under General von Tumpling defeated the Austrians and Saxons under Count Clam-Gallas, thus opening the way to a junction of the two Prussian armies and the subsequent victory of Sadowa. Pop., 1900, 9790, 1910, 10,204, mostly Czechs.

GIUDICE, ANTONIO DEL. See CELLAMARE.

GIUDICI, joo'dè-chê, PAOLO EMILIANI (1812-72). An Italian historian and man of letters, born in Sicily. At an early period he was influenced by his reading of Machiavelli, Voltaire, Foscolo, and Byron. During a few months of 1848 he was professor of Italian literature in the University of Pisa, but was removed because of his liberal tendencies. On the reestablishment of the Italian kingdom he was made professor of æsthetics and secretary of the Academy of Fine Arts at Florence. This second professorship he relinquished in 1862 and in 1867 was elected a deputy to the Italian Parliament. He died at Tunbridge, England, Sept. 8, 1872. It was his aim to show that Italian literature, which he judged with great independence, was due, not to the patronage of princes, but to the national consciousness. Giudici's chief works are *Storia della letteratura italiana* (4th ed., 1865), *Storia del teatro in Italia* (1869), *Storia dei comuni italiani* (1866), a translation of Macaulay's *History of England* (1856), and an essay, "Intorno ai poeti lirici d'Italia," prefaced to the *Florilegio dei lirici più insigni d'Italia* (1846-47). Consult *Biografia di Paolo Emiliani Giudici* (Florence, 1874).

GIUFFRIDA-RUGGERI (joo'f-frè'da-rōōg-gà'rè), VINCENTO (1872-) An Italian anthropologist, born in Catania. In 1896 he became a practicing physician in Rome, later he devoted himself to anthropology, which he taught at the University of Rome, the University of Pavia (1906-07), and, after 1907, at Naples, where he was director of the Anthropological Institute. He wrote *Sullà dignità morfologica dei segni degenerativi* (1907), *Homo sapiens Einleitung zu einem Kurse der Anthropologie* (1913), *L'Uomo attuale, una specie collettiva* (1913).

GIULIANI, joo-lyá'nè, GIAMBATTISTA (1818-84). An Italian philologist, born at Canelli (Piedmont). He studied at Asti and entered

the Somaschian Order in 1836, taking part, however, in the political movement about him. He was professor at various colleges in Italy and in 1860 was made professor of literature at the Istituto degli Studi Superiori of Florence. A special chair was created for him as lecturer on Dante, of whose works he had made a careful study. Among his writings on this subject are *Saggio di un nuovo commento della Commedia di Dante* (1845), *Le norme di commentare la Divina Commedia* (1856), *Metodo di commentare la Divina Commedia* (1861), *Lettere sul vivente linguaggio della Toscana* (1858-65), *Il Convito di Dante Alighieri reintegrato nel testo con nuovi commenti* (1874).

GIULIANO, joo'lya'nò, IN CAMPANIA. A city in the Province of Naples, central Italy, 8 miles northwest of the city of Naples (Map Italy, E 4). It has a baronial castle, and is delightfully situated in a plain that produces grain, vegetables, figs, and other fruit. The town also has manufactures of pottery. Pop. (commune), 1901, 14,363, 1911, 15,963.

GIULIANO DA MAJANO, joo'lya'nò da ma-ya'nò (1432-?91). A Florentine architect and sculptor in wood, of the early Renaissance. He was born in Majano and received his art education in Florence. There is much dispute about his life and work, because Vasari has confused him with Giuliano da Sangallo. We know from documentary evidence that in 1465 he began the church of Loreto, that in 1468 he rebuilt the collegiate church of San Gimignano, and in 1474 he began the cathedral of Faenza. In 1477 he was made chief architect of the cathedral of Florence. He was called to Naples in 1488 by King Alfonso of Aragon, for whom he built the fine Poggio Reale, now destroyed, and the Porta Capuana, one of the most beautiful gates of the Renaissance. He died at Naples after 1491. The Palazzo Strozzi, which ranks with the Pitti Palace (qv), among the finest palaces of the early Renaissance in Florence, is sometimes ascribed to him, but usually to his brother, Benedetto da Majano (qv). He was also famous as a sculptor in wood, having executed some of the finest intarsio work in Italy. His works in this line include the doors of the Sala d'Udienza, in the Palazzo della Signoria, Florence, some decorations in the Sagrestia Nuova, in the cathedral, the choir stalls of the cathedral of Perugia, an intarsio chest in the cathedral of Loreto.

GIULIARI, joo'lyä'rè, GIAMBATTISTA CARLO, COUNT (1810-92). An Italian historian of literature, born at Verona. He studied theology at Rome. From 1856 until his death he was canon at Verona and librarian of the Biblioteca Capitolare. He had the distinction of having established the first primary schools on Viennese models in his native city (1836). He was a member of the Berlin Akademie der Wissenschaften. His principal works are *Memoria bibliografica Dantesca* (1865), *Cinque discorsi dell'Alighieri dalla sua statua in Verona* (1865-63); *Colpe d'occhio sulle biblioteche d'Italia* (1867), *Storia della musica sacra in Verona* (1874-79), *Istoria monumentale letteraria, paleografica della Capitolare Biblioteca di Verona* (1882).

GIULIA VILLA. See VILLA GIULIA.

GIULINI, joo'le'nè, GIORGIO (1714-80). An Italian historian and antiquary, born at Milan. His work on the mediæval history of Milan (1760), based on original research of 20 years, is marked by great learning.

GIULIO ROMANO, joo'le-ò ró-má'nò. An Italian painter. See PIPPI, GIULIO.

GIULIO ROMANO. An Italian singer and composer. See CACCINI, GIULIO.

GIUNTA, joon'ta, **GIUNTI**, joon'te, **ZONTA**, zón'ta, or **JUNTA**. A family of celebrated Italian printers, originally from Florence. Two brothers, LUCA ANTONIO and FILIPPO, were booksellers in Florence as early as 1480, then the elder of the brothers went to Venice and founded a printing establishment which was continued after his death by his son TOMMASO and his cousins FILIPPO (1450-1517) started in Florence a printing house, celebrated for its editions of classics. His sons, BENEDETTO and BERNARDO, printed Boccaccio's *Decamerone* (1527). Other members of the family went to Rome, and several to Spain, where GIULIO and TOMMASO were printers to the King (1595-1624). Another, JACQUES FRANÇOIS JUNTE, founded a printing house at Lyons (1520), which lasted for a number of years.

GIUNTA PISANO, joon'ta pe-sa'nò (c. 1202-58). The earliest Italian painter to emerge from the crowd during the period before Cimabue. He flourished between about 1202 and 1258 in Pisa, which was then the art center of Tuscany and possessed an important school of sculpture, though painting was at a very low level. A "Crucifix" in Santa Raineri e Leonardo, Pisa, is undoubtedly by him, and he also signed and dated a "Crucifixion" (1236), now in Santa Maria degli Angeli, Assisi. Some authorities attribute to him the frescoes in the right transept of the upper church at Assisi (usually thought to be by Cimabue, qv), which are greatly inferior to those of the left transept. If he varies from the Byzantine school in giving dramatic action and pathos to his figures, they seem also to be exaggerated and barbarous. Consult Crowe and Cavalcaselle, *History of Painting in Italy*, vol. 1 (London, 1903), and Thode, *Franz von Assisi* (Berlin, 1885).

GIURA. See GYAROS.

GIURGEVO, joo'r'já-vò, Rum **GIURGIU**, joo'r'gòò (the city of St. George). A town of Rumania, in Wallachia, situated on the left bank of the Danube, opposite Rustchuk, 34 miles southwest of Bucharest, of which it is the port (Map Balkan Peninsula, E 3). The chief landing place for steamers is the island of Smarda, about 2 miles to the east. Giurgevo has a customhouse. The exports consist principally of grain, salt, and petroleum. Although the harbor is shallow, the annual shipping exceeds 1,000,000 tons, a considerable portion of which is carried in Austro-Hungarian vessels. Nearly all the commerce between Bulgaria and Rumania passes through the town. Pop., 1899, 13,078, 1910, 15,200. Founded by the Genoese in the fourteenth century, on the site of the Byzantine town of Theodorapolis, Giurgevo subsequently became an important military post under the rule of the Turks and was strongly fortified until 1829. During the wars between Russia and Turkey it was the scene of many engagements and was taken repeatedly by the Russians.

GIURGIU. See GIURGEVO.

GIUSSANI, joo's-sá'nè, CARLO (1840-1900). An Italian philologist, born at Milan, Italy. He was educated at the University of Turin, at the Accademia Scientifico-Litteraria of Milan, and at the University of Pisa (graduated 1864), and he also studied in Germany at Berlin, Tübingen, and Erlangen, where he acquired a

knowledge of Sanscrit and Zend. He is author of the "Grammatica sanscrita" in De Gubernatis' *Piccola enciclopedia indiana* (1868), and he translated the Indian philosophical poem, "Ashtavakraḡita," published in De Gubernatis' *Rivista orientale* (1867-68). Later he taught Latin at the Lyceo of Cremona and at the Accademia Scientifico-Litteraria, where he rose to be professor of Latin literature. He became known especially for his fine work on Lucretius, and he translated, from the German of Guhl, *Sopra la vita degli antichi greci e romani*.

GIUSTI, jōō'stē, GIUSEPPE (1809-50). One of the most celebrated and popular of the modern poets and satirists of Italy, born in Monsurmano, near Pistoia. Sprung from an influential Tuscan family, Giusti was early destined for the bar. He obtained his degree of LL.D. at the University of Pisa. On quitting Pisa Giusti was at Florence living with the advocate Capogquadri, and here he first attempted poetry. Lyrical compositions of the Romantic school, of elevated and nervous thought, were his earliest efforts, but he speedily saw that satire, not idealism, was his true forte. In a preeminent degree Giusti possessed the requirements of the great lyrical satirist—terseness, clearness, and brilliancy. His writings, attaining a wider and more immediate popularity than the purely lyrical verse of Manzoni and Leopardi, exercised great political influence. When the press was shackled, and freedom of thought was treason, his verses in manuscript were in general circulation throughout Italy and assisted in preparing the insurrection of 1848. Then for the first time Giusti discarded the pseudonym of "the Anonymous Tuscan," and signed his name to a volume of verses, bearing on the events and aims of the times. In his political poems he abandoned the beaten track and adopted many metrical forms instead of the conventional *terza rima*, or unrhymed hendecasyllables. All his compositions are short, rarely blemished with personalities, and written in the purest form of the popular Tuscan dialect. They are in spirit and wit not only Italian, but essentially Tuscan. A reverent student of Dante, Giusti himself often reaches an almost Dantesque sublimity in the higher outbursts of his wrath, while he stands alone in the lighter play of ironical wit. In politics, from taking an active part in which bad health prevented him, he was an enlightened and moderate Liberal. Giusti was beloved in private life for his social qualities and his loving and gentle spirit. He died in the dwelling of his friend the Marquis Gino Capponi at Florence. His most celebrated pieces are entitled *Lo stivale*, or the history of a boot (Italy), a humorous narration of all the misfits, ill usage, and patching allotted to this unfortunate down-trodden symbol of his country; *Gingillino*, a masterpiece of sarcasm, portraying the ignoble career of the sycophant; *Il Re Travicello*, or King Log; *Il Brindisi di Girella*, or the Weathercock's Toast, one of his best pieces, and the *Dies Ira*, or funeral oration of the Emperor Francis I, written in condemnation of the atrocities committed in the fortress prison of Spielberg. Several of Giusti's poems have been excellently rendered into English verse by W. D. Howells in *Modern Italian Poets* (1887), and into German by Paul Heyse in *Italiensche Dichter*, vol. iii (Berlin, 1887). Editions of Giusti's *Poesie* are those prepared by Carducci (Florence, 1859, 1893), Fioretto (Verona, 1876

and since), Bragi (Florence, 1890). Of his prose works, the *Epistolario*, or Correspondence, appeared, in a second edition (Florence, 1885), the *Epistolario scelto* (Naples, 1892). The best biography of Giusti is that prepared by Carducci for his edition of the *Poesie*. Consult also Carducci's essay on Giusti in his *Primi saggi* (Bologna, 1899), Biagi (ed.), *Vita di Giuseppe Giusti* (Florence, 1893), an autobiography, Leonardis, *Il Giusti lirico e il Giusti satirico* (Genoa, 1887), Horner, *The Tuscan Poet Giuseppe Giusti and his Times* (London, 1864), Speia, *Letteratura comparata* (Naples, 1896).

GIUSTINIANI, jōō'stē-nya'nē. An illustrious Italian family, distinguished in the annals of Venice and Genoa.—AGOSTINO GIUSTINIANI (1470-1536) was a great student of Arabic, Chaldee, Greek, and Hebrew. He prepared a polyglot edition of the Old Testament and had 2000 copies printed at his own expense.—MARCANTONIO GIUSTINIANI was Doge of Venice from 1684 to 1688, during which time the Venetians temporarily wrested the Morea from the Turks.—VINCENZO GIUSTINIANI in the seventeenth century built a magnificent palace among the ruins of Nero's baths at Rome and stocked it with treasures of painting and sculpture. He also formed a museum of antiquities, discovered on the spot. In 1807 the Giustiniani family conveyed the collection of paintings to Paris, where they disposed of the greater part by auction and privately sold the remainder, consisting of 170 fine paintings, to the artist Bonnemaison, who sold them to the King of Prussia. This fragment of the famous Giustiniani Gallery now enriches the Berlin Museum, and a very few of its former treasures are still to be found in the Giustiniani Palace at Rome. Consult Hopf Carlo, *Storia dei Giustiniani di Genova* (Genoa, 1882).

GIUSTINIANI, LEONARDO (1388-1446). An Italian poet, born at Venice, a humanist and a translator from the Greek, orator, epistolographer, and Procurator of San Marco, he is best remembered for his *canzonette*. The 27 strambotti that have been attributed to him contain all the themes of the Italian popular songs and resemble them in compactness of form and spontaneity of sentiment. Some of the *canzonette* set to music by Giustiniani himself and called *Giustimane*, sometimes *Veneziane*, were sung at banquets and upon festive occasions in general. Their subject matter is erotic, their tone familiar, and their language full of dialectal peculiarities. Consult Wiese, *Poesie edite ed inedite di Leonardo Giustiniani* (Bologna, 1883), Lamma, *Intorno ad alcune rime di Leonardo Giustiniani*, *Ghorn stor* (1887), Ortolan, *Appunti su Leonardo Giustiniani* (Feltre, 1896), and Oberdorfer's articles in *Ateneo Veneto* (1912). There is a biography by Fennigstein (Halle, 1909).

GIVET, zhē'vā'. A town in the Department of Ardennes, France, on both banks of the Meuse, about 1 mile from the Belgian frontier, and about 23 miles from the Belgian town of Namur (Map France, N, K 2). It was formerly a fortress of considerable strategical value, but in 1892 the fortifications were dismantled, and, with the exception of the citadel of Charlemont, converted into promenade grounds. In the European War of 1914 Givet was on the early line of the Allies' defense against the Germans and was the scene of a stubborn resistance by the British expeditionary force under Sir John

French in the latter end of August The town contains a number of breweries, tanneries, pencil factories, and marble quarries Pop, 1901, 6947, 1911, 7759

GIVORS, zhé'vôr'. A town in the Department of Rhône, France, on the Rhone and the Gier, 14 miles south of Lyons (Map France, S, J 3) It contains numerous establishments for the manufacturing of machinery, bottles, and window glass, and there are important coal mines in the vicinity. Pop, 1901, 12,132, 1911, 12,784

GIZEH See GHIZEH

GIZZARD, giz'ard (from OF *gizer*, Fl. *gésier*, gizzaid, from Lat *gigeria*, cooked entrails of poultry) A strong muscular portion of the alimentary tract, where hard solid food is broken up preparatory to digestion Gizzards are found in various groups of animals and have only a physiological likeness The best-known example is that of birds, which is the posterior compartment of the stomach, the front part being glandular and fitted to moisten the food to be crushed The degree of development of the gizzard of birds depends upon the hardness of the food eaten Grain-eating birds have the most powerful gizzards, insect-eating birds less powerful ones, while in birds of prey the gizzard is slightly developed The great anatomist, Hunter, indeed, believed that a strong gizzard could be cultivated in carnivorous birds by feeding them on grain, and this has been accomplished in the case of captive gulls In the gizzard of birds small stones are frequently found, which are swallowed by the bird to aid in triturating its food Among other animals in which a gizzard has been described are certain Rotifera, Bryozoa, the earthworm, the crayfish and its allies, and various insects, especially such as devour solid food The "gizzard" of insects and crustaceans is the fore stomach, or proventriculus, it is by some authors regarded as mainly a strainer See BIRD, ALIMENTARY SYSTEM

GIZZARD SHAD (so called from the shape

of its stomach) A name in Florida for the mud shad (q v) See Plate of HERRING AND SHAD

GJALLAR, yal'lar (Icel *yeller*). The horn which, according to Scandinavian mythology, Heimdall blows to notify the gods when a stranger is approaching the bridge Bifrost

GJELLERUP, yél'le-i-up, KARL ADOLF (1857-) A Danish novelist, born at Roholte, Zealand He became a warm advocate of Greek and German art and a devoted admirer of Richard Wagner, upon whose famous "Trilogy" he wrote the work entitled *Richard Wagner i hans Hovedværk Nibelungens Ring* (1890) Besides a collection of poems entitled *Min Kjærligheds Bog* (1889), and the dramas *Brynhild* (1884), *St Just* (1886), *Thamyris* (1887), *En Arkadisk Legende* (1887), *Hagbard og Signe* (1888), *Bryllupsgaven* (1888), *Herman Vandel* (1891), *Wuthorn* (1893), *Hans Excellence* (1895), *Mollen* (1896), *Gift og Modgift* (1898), *Offerildene* (1903), *Elskovsproven* (1906), and *Den Fuldendte Hustru* (1907), his works include several admirable tales of travel and the popular novels entitled *Det unge Danmark* (1879), *Germanernes Lærling* (1882), *Minna* (1889), *Romulus* (2d ed, 1903), *Vandreaaret* (1885), *Konvolutten* (1897), *Pilgrimen Kamanita* (1906), *Fra Vaar til Host* (1910), and *Verdensvandierne* (1910) His dramas are not well adapted to the stage, because of the deficiency of the dialogues, but his lyrical verses and novels are popular

GLACE (glas) **BAY** A town in Cape Breton Co, Nova Scotia, Canada, about 15 miles east-northeast of Sydney, on the Sydney and Louisburg Railway (Map Nova Scotia, K 2) It is an important coal-mining centre, about 10,000 miners being employed in the vicinity There are also a fishing industry, machine shops, and a wood-working factory Large supplies of coal are shipped from the harbor to Canadian and other ports An important Marconi wireless station is located here The town has a mining school, and owns its electric-lighting and water systems. Pop, 1901, 6945, 1911, 16,562.
